User manual

ROAD BIKE EN ISO 4210-2

Read at least pages 9-16 before your first ride!

Perform the functional check on pages 16-18 before every ride!

Observe the chapter “Intended use”, the service schedule, the bike card and the handover report!
Component description CENTURION road bike with rim brake

Frame:
1. Top tube
2. Seat tube
3. Down tube
4. Chainstay
5. Rear stay
6. Head tube

Wheel:

CENTURION user manual

This CENTURION user manual includes the following road bike types:

Road bikes
Cyclo-cross bikes

It is essential to also observe the instructions of the component manufacturers on this CENTURION CD-ROM. These operating instructions are subject to European law. If delivered to countries outside Europe, supplementary information has to be provided by the manufacturer of the CENTURION bike, if necessary.

Always keep yourself informed at www.centurion.de/en_int

Some notes on this CENTURION user manual

The illustrations on the first pages of the CENTURION user manual show typical CENTURION road bikes with rim and disc brakes and a cyclo-cross bike. One of these CENTURION road bikes looks similar to the CENTURION road bike you have purchased. Today’s road bikes come in various types that are designed for specific uses and fitted accordingly. This CENTURION user manual includes the following road bike types:

Road bikes (a+b) and cyclo-cross bikes (c)

Pay particular attention to the following symbols:

⚠️ This symbol indicates an imminent risk to your life or health unless you comply with the instructions given or take preventive measures.

❗️ This symbol warns you of wrongdoings which may result in damage to property and the environment.

ℹ️ This symbol provides you with information about how to handle the product or refers to a passage in the CENTURION user manual that deserves your special attention.

The described possible consequences will not be repeated in this CENTURION user manual every time one of the symbols appears.

This user manual is not intended to help you assemble a CENTURION road bike (d) from individual components, to repair it or to make a partly assembled CENTURION bike ready for use.

This CENTURION user manual is not applicable to any other than the displayed road bike types.

This CENTURION user manual complies together with this CENTURION CD-ROM with the standard EN ISO 4210-2.

Also observe the instructions of the component manufacturers on this CENTURION CD-ROM.
Dear CENTURION customer,

In purchasing this CENTURION bike (e-g) you have chosen a product of high quality. Each component of your new CENTURION road bike has been designed, manufactured and assembled with great care and expertise. Your CENTURION dealer gave the pedelec its final assembly and adjustment. This guarantees you pleasure and a sense of confidence from the very first turn of the pedals.

This manual contains a wealth of information on the proper use of your CENTURION road bike, its maintenance and operation as well as interesting information on bike design and engineering. Read the CENTURION user manual thoroughly. We are sure that even if you have been cycling all your life you will find useful and detailed information. Bike technology has developed at a rapid pace during recent years.

Therefore, before setting off on your new CENTURION road bike, be sure to read at least the chapter “Before your first ride”.

To ensure as much fun and safety as possible during cycling, be sure to carry out the functional check described in the chapter “Before every ride” before setting off on your CENTURION road bike.

Even a manual as big as an encyclopedia could not describe any possible combination of bicycle models and components or parts on the market. This CENTURION user manual therefore focuses on your newly purchased CENTURION road bike and standard components and provides useful information and warnings.

When doing any adjusting and maintenance work (h), be aware that the detailed instructions provided in your manual only refer to this CENTURION road bike.

The information included here is not applicable to any other bicycle type. As bicycles and pedelecs come in a wide variety of designs with frequent model changes, the routines described may require complementary information. It is essential to also observe the instructions of the component manufacturers on this CENTURION CD-ROM.

Be aware that these instructions may require further explanation, depending on the experience and/or skills of the person doing the work. For some jobs you may require additional (special) tools or supplementary instructions. This manual cannot teach you the skills of a bicycle mechanic.

This CENTURION CD-ROM includes the instructions of the component manufacturers as well as the relevant web links.
Before you set off, let us point out a few things to you that are very important to every cyclist. Never ride without a properly adjusted helmet and without glasses (a). Make sure to wear suitable, bright clothing, as a minimum you should wear straight cut trousers and or leg bands and shoes fitting the pedal system (b). Always ride carefully on public roads and observe the traffic rules so as not to endanger yourself or others.

This manual cannot teach you how to ride. Please be aware that cycling is a potentially dangerous activity that requires the rider to stay in control of his or her CENTURION road bike at all times. If necessary, attend a beginners course for cyclists, as offered here and there.

Like any sport, cycling involves the risk of injury and damage. By choosing to ride a bike, you assume the responsibility for the risk. Please note that on a bike you have no protection technique around you like you have in a car (e.g. bodywork, ABS, airbag). Therefore, always ride carefully and respect the other traffic participants.

Never ride under the influence of drugs, medication, alcohol or when you are tired. Do not ride with a second person on your CENTURION road bike and never ride without having both hands on the handlebars.

Observe the legal regulations for riding on public roads. These regulations may differ in each country. Only use your road bike on signposted and smooth, hard-surface roads and bike lanes (c).

First we would like to familiarize you with the various components used on your CENTURION road bike. Observe the component description on the front pages of this CENTURION user manual. There you will find a CENTURION road bike (d) with rim brakes, a CENTURION road bike with disc brakes and a CENTURION cyclo-cross bike showing all the essential components. They help you to easily locate the components as they are referred to in the text.

⚠️ For your own safety, never do any work or adjusting when servicing your bike unless you feel absolutely sure about it. If you are in doubt or if you have any questions, contact your CENTURION dealer.

⚠️ Please note: Do not hitch yourself and your bike to a car. Do not ride freehand. Only take your feet off the pedals, if required by the condition of the road.

CENTURION – FORGE AHEAD
Intended use

Keep in mind that every type of bike is designed for a specific use. Use your CENTURION bike only for its intended purpose, otherwise it may not withstand the loads and fail causing an accident with unforeseeable consequences! In addition, if you use your bike for another than its intended purpose, the warranty will become void.

Ask your CENTURION dealer to confirm the category your CENTURION bike belongs to.

CENTURION bikes in general are not intended for being used on bike trainers with clamps. The forces acting on the rear frame are highly increased compared to the forces arising when cycling outdoor and may result in frame failure. Therefore, do not use your CENTURION bike on a trainer to which it has to be clamped somehow. The use on free bike rollers is permitted.

CENTURION bikes used in extreme riding situations or competitions require clearly increased riding skills. Not all CENTURION bikes are suitable for such use. Ask your CENTURION dealer before such a use. If you decide to use your bike in such a way, you voluntarily assume a highly increased injury risk which can even result in death. In addition, your CENTURION bike is exposed to higher loads and you hereby accept a clearly reduced service life of the CENTURION bike.

Many magazines, advertisements, catalogs or films show riders engaged in extreme riding situations. These are professionals who have built up enormous riding skills during years of training. Always estimate your own limits defensively; do not overestimate you. Always wear adequate protective safety equipment. But even with state-of-the-art protective equipment you are at risk of being seriously injured or killed, when doing extreme riding maneuvers or participating in competitions.

Category 1: Street

CENTURION bikes of the category Street are designed for use on roads and bicycle lanes with tarred or paved surface, where the wheels remain in permanent contact to the ground. Observe the traffic rules when riding on public roads.

CENTURION bikes of this category are not designed for off-road use and for being used as touring and all-weather bike.

In general, these are road bikes with racing bars or straight handlebars. The tire is very narrow, i.e. 22 to maximum 28 mm in width. The maximum permissible additional load (rider plus baggage) is 120 kg. Under certain circumstances the maximum permissible additional load can be further limited by the component manufacturers’ recommendations for use.

The CENTURION models Gigadrive (e), Hyperdrive (f), Speeddrive (g) and Cityspeed (a, p.12) belong to this category.

For more information on the intended use of your CENTURION bike, see the bike card and the chapter “Before your first ride”.

Many magazines, advertisements, catalogs or films show riders engaged in extreme riding situations. These are professionals who have built up enormous riding skills during years of training. Always estimate your own limits defensively; do not overestimate you. Always wear adequate protective safety equipment. But even with state-of-the-art protective equipment you are at risk of being seriously injured or killed, when doing extreme riding maneuvers or participating in competitions.
Due to their design and fittings, CENTURION bicycles of this category are not always intended to be used on public roads. If you want to use them on public roads, these bikes must be fitted with the prescribed equipment. Observe the traffic rules when riding on public roads. For more information see the chapter “Legal requirements for riding on public roads”.

Be aware that the distance you need to stop your bike increases, when you are riding with your hands on aero handlebars. The brake levers are not always within easy reach.

CENTURION bikes of this category are not suitable for cycling off-road, jumps, slides, staircases, stoppies, wheelies, tricks etc.!

CENTURION bikes of this category are in general suitable for towing a trailer; the maximum trailer load should, however, not exceed 45 kg. Half of the trailer load is accounted for in the permissible additional load. Always observe the maximum speed indicated by the trailer manufacturer for the respective ground. The trailer must be mounted exclusively with an axle-mount coupling. If it cannot be mounted without problems due to the geometry of the drop-outs, do not use the model concerned. Contact your CENTURION dealer.
Category 2: Cross

CENTURION bikes of the category Cross are designed for hard-surface terrains, i.e. for tarred roads and bicycle lanes or gravel field tracks, sand or dirt paths open to bicycles. The wheels remain in permanent contact to the ground. Unintentional loss of contact of one wheel, e.g. for riding over a curb, is permitted.

CENTURION bikes of this category are not suitable for mountain bike use and jumps. Some bikes of this category have suspension elements. These serve the purpose of improving comfort and not the capability of cycling off-road.

These are in general cyclo-cross bikes (bikes for cyclo-cross sport) with 28-inch-wheels with narrow tires (28 to maximum 42 mm). The maximum permissible additional load (rider plus baggage) is 120 kg. Under certain circumstances the maximum permissible additional load can be further limited by the component manufacturers’ recommendations for use.

The CENTURION model Crossfire (e) belongs to this category.

Due to their design and fittings, CENTURION bicycles of this category are not always intended to be used on public roads. If you want to use them on public roads, these bikes must be fitted with the prescribed equipment. Observe the traffic rules when riding on public roads. For more information see the chapter “Legal requirements for riding on public roads”.

CENTURION bikes of this category are not suitable for jumps, slides, staircases, stoppies, wheelies, tricks etc.!

CENTURION bikes of this category are in general suitable for towing a trailer; the maximum trailer load should, however, not exceed 45 kg. Half of the trailer load is accounted for in the permissible additional load. Always observe the maximum speed indicated by the trailer manufacturer for the respective ground. The trailer must be mounted exclusively with an axle-mount coupling. If it cannot be mounted without problems due to the geometry of the drop-outs, do not use the model concerned. Contact your CENTURION dealer.
Before your first ride

1. If you want to use your pedelec on public roads, it has to comply with legal requirements. These requirements may vary in each country. The fittings of your CENTURION bike are, therefore, not necessarily complete (a). Ask your CENTURION dealer concerning the laws and regulations applicable in your country or in the country you intend to use your CENTURION road bike. Have your CENTURION road bike equipped accordingly before using it on public roads.

For more information see the chapter “Legal requirements for riding on public roads”.

2. Are you familiar with the brake system (b+c)? Have a look at the bike card and check whether the brake lever of the front brake is on the side you are used to (right or left). If it is not, ask your CENTURION dealer to switch the brake levers before you set off for the first time.

Your new pedelec is equipped with modern brakes which may be far more powerful than those you were used to so far. Be sure to first practice using the brakes on a level, non-slip surface off public roads! Slowly approach higher brake performances and speeds.

For more information see the chapter “The brake system” and the instructions of the component manufacturers on this CENTURION CD-ROM.
3. Are you familiar with the type and functioning of the gears (e)? Ask your CENTURION dealer to explain you the gear system and make yourself familiar with your new gears in an area free of traffic, if necessary.

For more information see the chapter “The gears” and the instructions of the component manufacturers on this CENTURION CD-ROM.

4. Are saddle and handlebars properly adjusted? The saddle should be set to a height from which you can just reach the pedal in its lowest position with your heel. Check whether your toes reach to the floor when you are sitting on the saddle (f). Your CENTURION dealer will be pleased to help you, if you are not happy with your seating position.

For more information see the chapter “Adjusting the CENTURION bike to the rider”.

5. If your CENTURION road bike is equipped with clipless or step-in pedals (g): Have you ever tried the shoes they go with? First practice locking one shoe onto a pedal and disengaging it while standing on the other leg. Ask your CENTURION dealer to explain you the pedals.

For more information see the chapter “The pedals and the shoes” and the instructions of the component manufacturers on this CENTURION CD-ROM.

Be aware that the distance you need to stop your bike increases, when you are riding with your hands on aero or triathlon handlebars (h). The brake levers are not always within easy reach.

Ride your CENTURION road bike exclusively with toe-clip or step-in pedals (clipless pedals). When using pedals without devices to hold your feet in the correct place (i.a. flat pedals), there is the risk of the foot colliding with the front wheel. Risk of an accident!

Be sure to use your CENTURION road bike only for its intended purpose, as it may otherwise not withstand the stress and fail. Risk of an accident!

Pay particular attention to the fact that there is enough clearance between your crotch and the top tube so that you do not hurt yourself when you have to get off your pedelec quickly.

Note that both braking effect and tire grip can be reduced drastically in wet conditions. Look well ahead when riding on wet roads and go well below the speed you would ride at in dry conditions.

A lack of practice when using clipless pedals or too much spring tension in the mechanism can lead to a very firm connection, from which you cannot quickly step out! Risk of an accident!
In case you had a crash with your CENTURION road bike, perform at least the check described in the chapter “Before every ride”. Ride back very carefully by taking the shortest route possible, even if your CENTURION road bike went through this check without any problems. Do not accelerate or brake hard and do not ride your pedelec out of the saddle. If you are in doubt, have yourself picked up by car, instead of taking any risk. Back home you need to check once again your CENTURION road bike thoroughly. If you are in doubt or if you have any questions, contact your CENTURION dealer!

Before towing a trailer (a) with your CENTURION road bike, contact your CENTURION dealer.

Before mounting a child seat, have a look at the bike card and contact your CENTURION dealer.

Before every ride

Your CENTURION road bike has undergone numerous tests during production and a final check has been carried out by your CENTURION dealer. Nevertheless, be sure to check the following points before every ride to exclude any malfunctioning that may be due to the transport of your CENTURION road bike or to changes a third person may have performed on your CENTURION road bike:

1. Are the quick-release levers (b), the thru-axles or the nuts of the front and rear wheel, the seat post (c) and other components properly closed?

For more information see the chapter “How to use quick-releases and thru axes” and the instructions of the component manufacturers on this CENTURION CD-ROM.

2. Are the tires in good condition and do they have sufficient pressure (d)? The minimum and maximum pressure (in bar or psi) is indicated on the tire side.

For more information see the chapter “The wheels and the tires” and the instructions of the component manufacturers on this CENTURION CD-ROM.
3. Spin the wheels to check whether the rims are true. If you have disc brakes, watch the gap between frame and rim or tire and, if you have rim brakes, between brake pad and rim. Untrue rims can be an indication of tires with ruptured sides, broken axles or spokes.

For more information see the chapter “The wheels and the tires” and the instructions of the component manufacturers on this CENTURION CD-ROM.

4. Test the brakes at standstill by firmly pulling the brake levers towards the handlebars (e). The brake pads of rim brakes must hit the rim evenly with their entire surface without touching the tire during braking or in open condition or in between. Make sure you cannot pull the brake levers all the way to the handlebars and check the hydraulic brake cables for leaks! Check the thickness of the brake pads, as well.

With disc brakes you should have a stable pressure point at once. If you have to actuate the brake lever more than once to get a positive braking response, have the CENTURION road bike checked by your CENTURION dealer immediately.

For more information see the chapter “The brake system” and the instructions of the component manufacturers on this CENTURION CD-ROM.

5. Let your CENTURION road bike bounce on the ground from a small height (f). If there is any rattling, see where it comes from. Check the bearings and bolted connections, if necessary. Tighten them slightly, if necessary.

6. Do not forget to take a high quality D- (g) or chain lock with you on your ride. The only way to effectively protect your CENTURION road bike against theft is to lock it to an immovable object.

7. If you want to ride on public roads, make sure your CENTURION road bike is equipped according to the applicable regulations of your country (h). Riding without lights and reflectors in dark or dim conditions is very dangerous because you will be seen too late or not at all by other road users.

A lighting set that corresponds to the regulations is a must on public roads. Turn on the lights as soon as dusk sets in.

For more information see the chapter “Legal requirements for riding on public roads”.
Improperly closed fastenings, e.g. quick-releases, can cause parts of your CENTURION road bike to come loose. This can result in a serious accident!

Be aware that the distance you need to stop your bike increases, when you are riding with your hands on aero or triathlon handlebars (a). The brake levers are not always within easy reach.

Do not use your CENTURION road bike, if it fails at one of these points! A defective CENTURION road bike can lead to serious accidents! If you are in doubt or if you have any questions, contact your CENTURION dealer.

During use your CENTURION road bike is undergoing stress resulting from the surface of the road and from the rider’s action. Due to these dynamic loads, the different parts of your pedelec react with wear and fatigue. Please check your CENTURION road bike regularly for wear marks, scratches (b), deformations, color changes and any indication of cracking. Components which have reached the end of their service life may break without previous warning. Let your CENTURION dealer maintain and service your CENTURION road bike regularly. In cases of doubt it is always best to replace components.

After an accident

1. Check whether the wheels are still firmly fixed in the drop-outs (c) and whether the rims are still centered with respect to the frame or fork. Spin the wheels and observe the gap either between brake pads and rim sides (d) or between frame and tire. If the width of the gap changes markedly and you have no way to true the rim where you are, you will need to open the rim brake a little by means of the special mechanism so that the rim can run between the brake pads without touching them.

Please note that in this case the brakes may not act as powerfully as you are used to.

No matter whether you have rim or disc brakes, have the wheels trued by your CENTURION dealer immediately after you are back home.

For more information see the chapters “The brake system”, “How to use quick-releases and thru axles” and “The wheels and the tires” as well as the instructions of the component manufacturers on this CENTURION CD-ROM.
2. Check that handlebars and stem are neither bent nor broken and that they are level and upright. Make sure the stem is firmly fixed on the fork by trying to turn the handlebars relative to the front wheel (e). Briefly lean on the brake levers/shifters to make sure the handlebars are firmly fixed in the stem. Realign the components, if necessary, and gently tighten the bolts (f) to ensure a reliable clamping of the components.

The maximum torque values are printed directly on the components or specified in the instructions of the component manufacturers on this CENTURION CD-ROM.

For more information see the chapters “Adjusting the CENTURION bike to the rider” and “The headset” and the instructions of the component manufacturers on this CENTURION CD-ROM.

3. Check whether the chain still runs on the chainwheels and the sprockets. If your CENTURION road bike fell over to the chain side, verify the proper functioning of the gears. Ask somebody to lift your CENTURION road bike by the saddle and carefully shift through all the gears. Pay particular attention when switching to the small gears, making sure the rear derailleur does not get too close to the spokes as the chain climbs onto the larger sprockets (g).

If the rear derailleur or the drop-outs/derailleur hanger is bent, the rear derailleur may collide with the spokes. This in turn can destroy the rear derailleur, the rear wheel or the frame. Check the function of the front derailleur, as a displaced front derailleur can throw off the chain, thus interrupting the drive of your CENTURION road bike.

For more information see the chapter “The gears” and the instructions of the component manufacturers on this CENTURION CD-ROM.

4. Make sure the saddle is not twisted by using the top tube or the bottom bracket shell as a reference (h). If necessary, open the clamping, realign the saddle and retighten the clamping.

For more information see the chapters “Adjusting the CENTURION bike to the rider” and “How to use quick-releases and thru axles” and the instructions of the component manufacturers on this CENTURION CD-ROM.

5. Let your CENTURION road bike bounce on the ground from a small height. If there is any rattling, see where it comes from. Check the bearings and bolted connections, if necessary. Tighten them slightly, if necessary.

6. Finally, take a good look at the whole CENTURION road bike to detect any deformations, color changes or cracks.
Ride back very carefully by taking the shortest route possible, even if your CENTURION road bike went through this check without any problems. Do not accelerate or brake hard and do not ride your pedelec out of the saddle. If you are in doubt about the performance of your CENTURION bike, have yourself picked up by car, instead of taking any risk.

Back home you need to check your CENTURION road bike thoroughly (a). Damaged parts must be repaired or replaced. Ask your CENTURION dealer for advice.

For more information on carbon components see the chapter “Special characteristics of carbon” and the instructions of the component manufacturers on this CENTURION CD-ROM.

Deformed components, especially components made of aluminum, can break without previous warning. They must not be repaired, i.e. straightened, as this will not reduce the imminent risk of breakage. This applies in particular to the fork, the handlebars, the stem, the cranks, the seat post and the pedals. When in doubt, it is always the better choice for your safety to have these parts replaced. Ask your CENTURION dealer for advice.

If your CENTURION road bike is assembled with carbon components (b+c), it is imperative that you have it checked by your CENTURION dealer after an accident or similar incident. Carbon is extremely strong and durable with very low weight, making it perfect for the production of high-performance parts. However, one of the inherent properties of carbon is that possible overstress may compromise the inner carbon-fiber structure without showing any visible deformation, as is the case with steel or aluminum. A damaged component can fail without previous warning. Risk of an accident!

Make it a rule to check the functioning and in particular the limit stop (d) of the rear derailleur after a fall or if your CENTURION road bike has toppled over.
How to use quick-releases and thru axles

Most CENTURION road bikes are fitted with quick-releases to ensure fast adjustments, assembly and dis-assembly. Be sure to check whether all quick-releases are tight before you set off on your CENTURION road bike. Quick-releases should be handled with greatest care, as they affect your safety directly.

Practice the proper use of quick-releases to avoid any accidents.

Quick-release mechanisms essentially consist of two operative elements:

1. The hand lever (e) on one side of the hub which creates a clamping force via a cam when you close it.

2. The tightening nut (f) on the other side of the hub with which the preload on the threaded rod (quick-release axle) is set.

Do not touch the brake disc directly after having stopped, e.g. after a long down-hill ride, you may burn your fingers! Always let the brake disc cool down before opening the quick-release.

Make sure the levers of both wheel quick-releases are always on the side opposite to the chain (g). This will help you to avoid mounting the front wheel accidentally the wrong way round. In the case of CENTURION bikes with disc brakes and quick-releases having a 5-mm-axle, it may be reasonable to mount both quick-releases with the lever on the side of the chain drive. This helps you not to come into contact with the hot brake disc and prevents you from having your fingers burnt. If you are in doubt or if you have any questions, contact your CENTURION dealer.

Never ride a CENTURION road bike without having checked first whether the wheels are securely fastened. With an insufficiently closed quick-release the wheel can come loose, thus creating a serious risk of accident!

If your CENTURION road bike has thru axles (h), read the instructions of the thru-axle and wheel manufacturers on this CENTURION CD-ROM.

If your CENTURION road bike is equipped with quick-releases, be sure to lock the frame to an immovable object together with the wheels when you leave it outside.
How to fasten components securely with a quick-release

Open the quick-release. You should now be able to read “Open” on the lever (a). Make sure the component to be fastened is in the accurate position.

For more information see the chapters “Adjusting the CENTURION bike to the rider” and “The wheels and the tires” and the instructions of the component manufacturers on this CENTURION CD-ROM.

Move the lever back, as if to close it. Now you should be able to read "Close" on the outside of the lever (b). When you start closing the lever you should feel virtually no resistance with your hand until the lever is at a right angle to the frame/fork.

When continuing to close the lever the resistance you feel should increase significantly and towards the end even more strength is required to close the lever. Use the ball of your thumb while your fingers pull on an immovable part, such as the fork (c) or a rear stay, but not on a brake disc or spoke, to push it in all the way.

In its end position, the lever should be at a right angle to the quick-release axle, i.e. it should not stand out. The lever should lie close to the frame or the fork so that it cannot be opened accidentally. Make sure, however, that the lever is easy to handle for actual quick use.

To check whether the lever is securely locked apply pressure to the end of the hand lever and try to turn it while it is closed. If you can turn the lever around, open it and increase the preload. Screw the tightening nut on the opposite side clockwise by half a turn. Close the quick-release lever and check it again for tightness.

Finally lift the bike so that the wheel is suspended a few centimeters from the ground and hit the tire from above (d). If it is properly fastened, the wheel will remain firmly fixed in the drop-outs of the frame or fork without producing any rattling.

If your seat post is equipped with a quick-release mechanism, check whether the saddle is firmly fixed by trying to twist it relative to the frame.

To be on the safe side you can replace the quick-releases by special locks. They can only be opened and closed with a special, coded key or an Allen key. If you are in doubt or if you have any questions, contact your CENTURION dealer.
How to fasten components securely with a thru axle

Formula XQR 15 (road bikes and cyclo-cross bikes)

The Formula thru axle (e) for road and cyclo-cross road bikes is a typical Formula thru axle with an internal dimension of 100 mm and a thread in the fork.

Mounting wheels
If your bike is equipped with a Formula thru-axle system with quick-release lever, put the front wheel into the fork and mount the rotor in the brake caliper.

Bring the front wheel into the right position between the drop-outs and slide the axle with open Formula quick-release levers from the right side through the drop-out and the hub.

Make sure the quick-release lever is completely open and lies in the axle recess. When the axle thread engages with the thread of the left fork leg, turn the axle clockwise. During the first turns you should be able to turn the thru axle nearly without resistance.

Subsequently, turn the lever forcefully clockwise until the axle is hand-tight. Make sure the quick-release lever does not slide off the recess in the axle.

Finish by closing the Formula thru axle quick-release lever like a usual quick-release lever. The quick-release lever must not stand out to the front or to the side and should fit snugly to the lower leg.

Improperly mounted wheels may throw you off your bike or result in serious accidents!

Before mounting or replacing a fork/wheel combination with thru-axle system, be sure to read first the operating instructions of the respective fork or wheel manufacturer on this CENTURION CD-ROM.
**RWS system from DT Swiss**

The RWS system from DT Swiss for road bikes consists of thru axles (a) which provide the forks and the rear frames with higher stiffness. Whenever your CENTURION bike is exposed to high loads, it remains comparably directionally stable.

**Mounting wheels**

If you have disc brakes, check before mounting the wheel whether the brake pads rest snugly in their seats in the brake caliper body. The gaps between the brake pads and the wheel should be parallel and the wear indicators in their correct position.

Put the wheel into the fork and mount the rotor simultaneously, if necessary, in the brake caliper. Make sure that you push the brake disk between the brake pads.

Bring the front wheel into the right position between the drop-outs and slide the thru axle with open quick-release lever from the left side through the drop-out and the hub (b).

As soon as you have reached the opposite side, turn the thru axle clockwise into the nut on the right side. Do not apply force, but make sure the axle thread engages properly with the nut on the other side.
During the first turn you should be able to turn the RWS quick-release lever of the thru axle nearly without resistance. If everything fits, turn the RWS quick-release lever clockwise to pre-tighten the RWS system (e).

You will feel an increasing resistance at the lever. Only turn the axle until it is hand-tight.

Open the RWS quick-release lever a little to bring it into a favorable position. Turn the RWS quick-release lever then into the desired position and re-close it towards the hub.

Make sure the RWS quick-release lever at the fork does not stand out to the front (f).

Dismounting wheels
Turn the quick-release lever counterclockwise. Release the thru axle completely, hold the wheel in its position and remove the axle from the hub.

⚠️ Improperly mounted wheels may throw you off your bike or result in serious accidents! If you have the slightest doubt or in case of inquiries, contact your CENTURION dealer.

⚠️ After wheel mounting test the brakes at standstill. You should reach the pressure point of the brake before the brake lever reaches the handlebars. In the case of hydraulic brakes pump them, if necessary, until you reach a precise pressure point.
Adjusting the CENTURION bike to the rider

Your body height and proportions are decisive for the frame size of your CENTURION road bike. Make particularly sure there is enough space between your crotch and the top tube so that you do not hurt yourself, if you have to get off your bike quickly (a).

By choosing a specific type of bike you roughly determine the posture you will be riding in (b+c). However, some components of your CENTURION road bike are especially designed so that you can adjust them to your body proportions up to a certain degree. This includes the seat post, the handlebars and the stem as well as the brake levers/shifters.

As all works require know-how, experience, suitable tools and skills, you should restrict yourself to adjusting your seating position. Contact your CENTURION dealer, if you are not happy with your seating position or if you want something changed. They will see to your wishes the next time you leave your CENTURION road bike at the workshop, e.g. for the first inspection.

After any adjustment/assembly work, be sure to make a short functional check as described in the chapter “Before every ride” and do a test ride on your CENTURION road bike in an area free of traffic.

If you have a very small frame, there may be the danger of your foot colliding with the front wheel. If your bike has clipless pedals, make sure the cleats are properly adjusted.

Ride your CENTURION road bike exclusively with toe-clip or step-in pedals (clipless pedals). When using pedals without devices to hold your feet in the correct place (i.a. flat pedals), there is the risk of the foot colliding with the front wheel. Risk of an accident!

All tasks described in the following require the know-how of a mechanic and appropriate tools. Make it a rule to tighten the bolted connections always with greatest attention. Increase the torque values bit by bit and check the fit of the component in between. Use a torque wrench and never exceed the maximum torque values! You will find the prescribed values in the chapter “Recommended torque settings”, directly on the components and/or in the operating instructions of the component manufacturers on this CENTURION CD-ROM.

If sitting on the saddle causes you trouble, e.g. because it numbs your crotch, this may be due to the saddle (d). Your CENTURION dealer has a very wide range of saddles available and will be pleased to advise you.

The seating position depends highly on how you want to use the CENTURION road bike. Ask your CENTURION dealer or your trainer for help. The advice given below is suitable for typical CENTURION road bikes.
Adjusting the saddle to the correct height

The correct saddle height depends on the length of your legs. When pedaling, the ball of your foot should be positioned above the center of the pedal axle. With your feet in this position you should not be able to stretch your legs completely straight at the lowest point, otherwise your pedaling will become awkward.

Check the height of your saddle with flat-soled shoes. This is best done with suitable cycling shoes.

Rule of thumb to determine the suitable saddle height: inseam length x 0.885

Sit on the saddle and put your heel on the pedal at its lowest point. Your leg should be fully stretched and your hips should remain horizontal.

To adjust the saddle height loosen the quick-release lever (see the chapter “How to use quick-releases and thru axles”) or the binder bolt of the seat post clamp (e) at the top of the seat tube. The latter requires suitable tools, e.g. an Allen key, with which you turn the bolt two to three turns counterclockwise. Now you can perform the vertical adjustment of the seat post.

Be sure not to pull out the seat post too far. The mark on the seat post (f) (max., min., stop or the like) should always remain within the seat tube. Always grease the surface of an aluminum or titanium seat post that is inserted into a seat tube made of aluminum, titanium or steel. Do not grease carbon seat posts and/or carbon seat tubes in the clamping area! Use special carbon assembly paste instead.

Align the saddle with the frame by using the saddle nose and the bottom bracket or top tube as a reference point.

Clamp the seat post tight again by closing the quick-release, as described in the chapter “How to use quick-releases and thru axles” or by turning the seat post binder bolts clockwise in half turns (g). You should not need much strength in your hands to clamp the seat post sufficiently tight. Otherwise the seat post does not match the frame.

Verify in between that the seat post is sufficiently tight by taking hold of the saddle at both ends and then trying to rotate the seat post inside the seat tube (h). If it does rotate, gently retighten the binder bolt of the seat post clamp by half a turn and do the check again.

Does the leg stretch test now produce the correct result? Check by moving your foot and pedal to the lowest point. When the ball of your foot is exactly above the pedal center in the ideal pedaling position, your knee should be slightly bent. If yes, the saddle height is adjusted to the correct height.

Check whether you can touch the ground safely while sitting on the saddle by stretching your feet to the floor. If not, you should lower the saddle until you can, at least to begin with.
Never apply grease or oil into a seat tube of a frame made of carbon unless an alloy sleeve is inside the frame. If you mount a carbon seat post, do not put any grease on it, even if the frame is made of metal. Once greased, carbon components may never again ensure reliable clamping! Use special carbon assembly paste instead (a).

Make sure not to overtighten the binder bolt of the seat post clamp. Otherwise you may damage the seat post or the frame. Risk of an accident!

Never ride your bike with the seat post drawn out beyond the limit, maximum or stop mark! The seat post might break or cause severe damage to the frame. In the case of frames with seat tubes that extend beyond the top of the frame’s top tube the seat post should be inserted into the seat tube at least below the bottom of the top tube and below the top of the rear stays! If seat post and frame require different minimum insertion depths, you should opt for the deeper insertion depth.

If the seat post does not move easily inside the seat tube or if it cannot be tightened sufficiently, ask your CENTURION dealer for advice. Do not use brute force!

Tighten carefully by approaching the prescribed maximum torque value in small steps (0.5 Nm increments) and check in between the proper fit of the component. Never exceed the maximum torque value indicated by the manufacturer!

**Adjusting the height of the handlebars**

In principle, CENTURION road bikes are sports bikes designed for speed. For this reason alone riding a CENTURION road bike requires certain basic preconditions of the trunk, shoulder and neck muscles. The height of the handlebars compared to the saddle and the distance between saddle and handlebars determines how much your upper body will be inclined forward. Lowering the handlebars gives you a streamlined position and brings more weight to bear on the front wheel. However, it also entails an extremely forward leaning posture which is tiring and less comfortable, because it increases the strain on your wrists, arms, back, upper body and neck. As a general rule you should be able to grip all three basic positions of the handlebars (b-d) without any discomfort on a road bike.

In the case of road bikes an Aheadset®-stem allows the vertical adjustment of the handlebars. This adjustment requires special knowledge. In this regard, the descriptions hereafter may be incomplete. If you are in doubt or if you have any questions, contact your CENTURION dealer.
Stems come in varying lengths (e) as well as shaft and binder tube diameters. A stem of inappropriate dimension can become a source of danger: Handlebars or stems can break, resulting in an accident. When replacing any parts, be sure to only use parts that bear the appropriate mark and, to be on the safe side, original spare parts. Your CENTURION dealer will be pleased to help you.

The stem is one of the load-bearing parts of your CENTURION bike. Changes to it can impair your safety. If you are in doubt or if you have any questions, contact your CENTURION dealer!

The bolted connections of stem and handlebars have to be tightened to the prescribed torque values (f). If you disregard the prescribed values, the handlebars or stem may come loose or break. Use a torque wrench and never exceed the maximum torque values! You will find the prescribed values in the chapter “Recommended torque settings”, directly on the components and/or in the operating instructions of the component manufacturers on this CENTURION CD-ROM.

These routines require a certain amount of manual skill and (special) tools. Ask your CENTURION dealer to explain you both function and adjustment of your stem or let him do that work.

Make sure the handlebar/stem combination is approved by the handlebar and/or stem manufacturer.

Make sure the handlebar clamping area is free of sharp edges.

Stems for threadless systems, the AHeadset®-system

In the case of CENTURION bikes with AHeadset® headsets the stem also serves to adjust the bearing preload. If you change the position of the stem you have to readjust the bearing play (see the chapter “The headset” and the instructions of the component manufacturers on this CENTURION CD-ROM).

The vertical setting range is determined by the intermediate rings, also referred to as spacers (g). In the case of flip-flop stem models the stem can be mounted the other way round to achieve a different handlebar height.

Unscrew the bolt at the top of the fork steerer tube which serves to adjust the initial bearing pressure, remove the AHead cap and release the bolts on either side of the stem by up to three turns (h). Remove the stem and spacers from the fork steerer tube. In doing so keep hold of both frame and fork to prevent the fork from slipping off the head tube.
You can determine the handlebar height by the arrangement of stem and spacers. Slip the remaining spacers onto the fork steerer tube above the stem. Adjust the headset, as described in the chapter “The headset”.

If you want to turn the stem around, you have to also release the faceplate bolts securing the handlebars (a). If the stem is fitted with a cap, you can simply take out the handlebars at this point. If it is not fitted with a cap, you have to remove the handlebar fittings. Observe the lengths of the cables.

Mount the handlebars and, if necessary, the handlebar fittings, as described in the chapter “Adjusting the tilt of the handlebars and brake levers of CENTURION road racing machines and CENTURION cyclo-cross bikes” and/or in the instructions of the component manufacturers on this CENTURION CD-ROM.

Check whether the handlebars are firmly seated in the stem by trying to rotate the handlebars downwards (b). Verify whether the handlebar/stem unit can be twisted relative to the fork. Do this by taking the front wheel between your knees and trying to twist the handlebars. If there is movement, carefully tighten the bolts a little more and check the proper fit again.

Tighten carefully by approaching the prescribed maximum torque value in small steps (0.5 Nm increments) and check in between the proper fit of the component. Never exceed the maximum torque value indicated by the manufacturer!

These routines require a certain amount of manual skill and (special) tools, and are best left to your CENTURION dealer. If you still wish to do this by yourself, carefully read through the instructions of the stem manufacturer on this CENTURION CD-ROM beforehand.

In the case of turned stems, it is possible that the cables are too short. In this case riding can be unsafe. Ask your CENTURION dealer for advice.

When removing spacers the fork steerer tube should be shortened. This change is irreversible. The shortening should be carried out by your CENTURION dealer, but only after you have found your preferred position.

Stems come in varying lengths as well as shaft and binder tube diameters (c). A stem of inappropriate dimension can become a source of danger: Handlebars or stems can break, resulting in an accident. When replacing any parts, be sure to only use parts that bear the appropriate mark and, to be on the safe side, original spare parts. Your CENTURION dealer will be pleased to help you.

Keep in mind that readjusting the position of the stem changes the position of the handlebars and of the brake levers/shifters. Readjust these components (d), as described in the chapter “Adjusting the tilt of the handlebars and brake levers of CENTURION road racing machines and CENTURION cyclo-cross bikes”.

G These routines require a certain amount of manual skill and (special) tools, and are best left to your CENTURION dealer. If you still wish to do this by yourself, carefully read through the instructions of the stem manufacturer on this CENTURION CD-ROM beforehand.

In the case of turned stems, it is possible that the cables are too short. In this case riding can be unsafe. Ask your CENTURION dealer for advice.

When removing spacers the fork steerer tube should be shortened. This change is irreversible. The shortening should be carried out by your CENTURION dealer, but only after you have found your preferred position.

Stems come in varying lengths as well as shaft and binder tube diameters (c). A stem of inappropriate dimension can become a source of danger: Handlebars or stems can break, resulting in an accident. Keep in mind that readjusting the position of the stem changes the position of the handlebars and of the brake levers/shifters. Readjust these components (d), as described in the chapter “Adjusting the tilt of the handlebars and brake levers of CENTURION road racing machines and CENTURION cyclo-cross bikes”.
Correcting the fore-to-aft position and horizontal tilt of the saddle

The inclination of your upper body (e), and hence your riding comfort and pedaling power, are also influenced by the distance between the grips of the handlebars and the saddle. This distance can be altered slightly by changing the position of the saddle rails in the seat post clamp. However, this also influences your pedaling. Whether the saddle is positioned more to the front or to the back of the pedelec will alter how rearward the pedaling position of your legs is. You need to have the saddle horizontal in order to pedal in a relaxed manner. If it is tilted, you will constantly have to lean against the handlebars to prevent yourself from slipping off the saddle.

The bolted connections of the seat post have to be tightened to the prescribed torque values (f). Use a torque wrench and never exceed the maximum torque values! You will find the prescribed values in the chapter “Recommended torque settings”, directly on the components and/or in the operating instructions of the component manufacturers on this CENTURION CD-ROM.

Make sure the saddle is clamped within the range of the marking on the saddle rail (g). Otherwise the saddle rail can fail! Check the bolts by using a torque wrench once a month according to the prescribed values.

The setting range of the saddle is very small. Replacing the stem allows you to make far bigger adjustments to the rider’s fore-to-aft position, as stems come in different lengths. In doing so, you may achieve differences of more than ten centimeters. In this case you usually would have to adjust the lengths of the cables – a job best left to your CENTURION dealer!

The manufacturers of saddles normally provide detailed instructions on this CENTURION CD-ROM. Read them carefully before adjusting the position of your saddle. If you are in doubt or if you have any questions, contact your CENTURION dealer.

Adjusting saddle position and tilt

With patent seat posts (h) one central Allen bolt secures the clamping mechanism, which controls the tilt and the horizontal position of the saddle. Some seat posts have two bolts side-by-side.

Release the bolt(s) at the top of the seat post. Release the bolt(s) two to three turns counterclockwise at the most, otherwise the whole assembly can come apart. Move the saddle forth or back, as desired. You may have to give the saddle a light blow to make it move. Please observe the markings on the saddle rail.
Make sure the seat of the saddle remains horizontal \((a)\) as you retighten the bolt(s). Your CENTURION bike should stand on level ground while you adjust the saddle.

Having found your preferred position, make sure both clamp halves fit snugly around the saddle rails before tightening the bolt(s) to the correct torque value as prescribed by the seat post manufacturer.

Retighten the bolt(s) with a torque wrench according to the instructions of the manufacturer. After fastening the saddle, check whether it resists tilting by bringing your weight to bear on it once with your hands at either end of the saddle.

**Check the bolts by using a torque wrench once a month according to the values indicated directly on the components and/or in the instructions of the component manufacturers on this CENTURION CD-ROM.**

Poorly tightened or loosening bolts can fail. Risk of an accident!

**Clamping with two bolts in line \((b)\):** release both bolts two to three turns counterclockwise, otherwise the whole assembly can come apart. Move the saddle forward or backward as desired to adjust the horizontal position. You may have to give the saddle a light blow to make it move. Please observe the markings on the saddle rail.

Having found your preferred position, make sure both clamp halves fit snugly around the saddle rails before tightening the bolt(s) to the correct torque value as prescribed by the seat post manufacturer.

Tighten both bolts evenly \((c)\) so that the saddle remains at the same angle. If you wish to lower the nose of the saddle a little, tighten the front bolt clockwise. You might have to loosen the rear bolt a little as well. To lower the rear part of the saddle, the rear bolt has to be tightened clockwise and the front bolt to be released, if necessary.

After fastening the saddle, check whether it resists tilting by bringing your weight to bear on it once with your hands at either end of the saddle \((d)\).

**Check the bolts by using a torque wrench once a month according to the values indicated directly on the components and/or in the instructions of the component manufacturers on this CENTURION CD-ROM.**

Poorly tightened or loosening bolts can fail. Risk of an accident!
If you have a single bolt system (e), the seat post for most of the sports saddles is designed for a saddle rail diameter of 7 mm. Replacement outer clamps for ovalized saddle rails of 8 mm x 8.5 mm (W x H) as well as for carbon saddle rails bigger than 8 x 8.5 mm are also available. If you are not sure which saddle rail type you have or if you need further information, contact your CENTURION dealer.

To mount the saddle unscrew the transversal fixing bolt (f) as far as possible without loosening the lock nut on the outer side of the clamping device. In general, it is not necessary to take the mechanism completely apart, if it is already equipped with the correct outer clamps for your saddle.

If you do find it necessary to unscrew the single fixing bolt completely, remove it from the clamping device. This releases the outer clamping parts. The inner clamping parts are held in position with a rubber retention plate. Mount the saddle rails into the inner clamping parts, add the outer parts and re-insert the fixing bolt.

If the width of the saddle rails does not fit exactly into the clamp grooves, do not try to force them in. The clamping mechanism or the saddle rails could break and result in an accident and/or injuries to the rider. Use a different saddle model or contact your CENTURION dealer.

If the saddle rails fit into the clamp grooves, slide the saddle on the seat post and ensure that the clamp is positioned midway along the total length of the rails (g). Position the saddle so that its upper surface is parallel to the ground. Tighten the bolt gradually and make sure

1) the clamping device is still accurately mounted on the carbon seat post head and
2) the clamp is tightening evenly around each rail.

Once there is uniform hold on both rails, tighten the bolt gradually with a torque wrench (h) until you have reached the maximum torque value indicated in Newton meters (Nm) on the seat post.

After fastening the saddle, check whether it resists tilting by bringing your weight to bear on it once with your hands at either end of the saddle.

- **Check the bolts by using a torque wrench once a month according to the values indicated directly on the components and/or in the instructions of the component manufacturers on this CENTURION CD-ROM.**

- **Poorly tightened or loosening bolts can fail. Risk of an accident!**
Adjusting the brake lever reach on CENTURION road bikes

With road bikes the clearance between shift/brake levers and handlebar can be adjusted to a minor degree. This gives riders with small hands the convenience of bringing the brake levers closer to the handlebars.

The first phalanx respectively of the index and the middle finger must reach around the brake lever (a).

Braking from the top with your hands on the upper end of the brake grips is not an alternative in the long run and in hazardous situations, you need more manual force and cannot support yourself appropriately.

In the case of Shimano’s Dura-Ace unscrew the chrome cover and tighten the screw positioned in the front (b). In the case of the Ultegra you need special insert pieces (c). In the case of both Di2 models you reach the screws from the rear, after you have removed the hoods.

In the case of SRAM brake levers/shifters start by setting the cam disc on the slightly pulled and inward moved shifters. Screw in the screw positioned behind the hood in the body by using an Allen key.

In the case of flat bars there is a small adjusting bolt where the brake hose of a side-pull brake runs into the brake lever unit or on the lever itself.

Check the proper adjustment and functioning of the brake system subsequently, as described in the chapter “The brake system” and/or in the brake manufacturer’s instructions on this CENTURION CD-ROM.

If you have problems reaching the levers, please contact your CENTURION dealer.

⚠️ Make sure you cannot pull the brake levers all the way to the handlebars. Your maximum braking force must be reached short of this point! If necessary, you have to readjust the gap between brake pad and rim. If you are in doubt or if you have any questions, contact your CENTURION dealer.

⚠️ Note that the bolted connections of the stem, handlebars and brakes have to be tightened to the specified torques. You will find the prescribed values in the chapter “General notes on care and servicing” or in the instructions of the component manufacturers on this CENTURION CD-ROM. If you disregard the prescribed values, the components may come loose or break. This can lead to a severe crash.
Adjusting the tilt of the handlebars and brake levers of CENTURION road racing machines and CENTURION cyclo-cross bikes

The ergonomically best position is achieved with the straight extensions below the drops in parallel to the ground or pointing slightly downwards towards the rear (d). The ends of the brake lever/shifter units should meet an imaginary extension of the bottom line of the drops, the upper part of the lever will then be in horizontal position or point slightly upwards. Shifting the brake levers/shifters is a job best left to your CENTURION dealer, as it involves retaping the handlebars afterwards.

To adjust the tilt of the handlebars, release the Allen bolt(s) on the underside or front side of the stem (e). Turn the handlebars to the desired position. Make sure the handlebars are accurately centered in the stem (f).

Tighten all bolts with an Allen key by applying little force until the upper and the lower clamping slots of the handlebar clamp between faceplate and stem body are equal in width. Tighten the bolts alternately and in small increments with a torque wrench to the lower value of the recommended torque values. The recommended torque values for 4-bolt-stems are 5-6 Nm. In the case of 4-bolt-faceplates tighten the bolts evenly in a cross pattern.

Exception: some Procraft stems. Read in this regard the chapter “Special case Procraft ST1 und ST1.17” and the manufacturer’s instructions on this CENTURION CD-ROM.

Once clamped in the stem try rotating the handlebars and tighten the bolt a little more, if necessary. Use a torque wrench and never exceed the maximum torque values given in the chapter “Recommended torque settings”, directly on the components and/or in the instructions of the component manufacturers on this CENTURION CD-ROM.

Special case Procraft stem ST1 und ST1.17

During the assembly of the stem models Procraft ST1 und ST1.17 make sure the white spots point upwards.

Tighten the two stem bolts marked with a spot on the side to a torque of 5 Nm by using a torque wrench. During tightening the gap closes to the full. In the final position the gap has disappeared (g).

Continue by tightening the two bolts on the other side also to a torque of 5 Nm.

A gap remains open (h).

⚠️ Observe the prescribed torque values and do not exceed them!

ℹ️ Observe the details in the instructions of the brake and gear manufacturers. If you have any questions contact your CENTURION dealer.
Adjusting the brake lever reach on CENTURION road bikes with flat handlebars

With most brake systems the distance between the brake levers and the handlebar grips is adjustable. This gives in particular riders with small hands the convenience of bringing the brake levers closer to the handlebars (a).

On most bikes there is a small adjusting screw near the point where the brake cable of a cable brake enters the brake lever unit or at the lever itself. Turn this screw clockwise (b) and watch how the lever adjusts as you do so.

Hydraulic brakes are also fitted with adjusting devices at the brake lever. There are different systems. Ask your CENTURION dealer for advice or read the instructions of the component manufacturers on this CENTURION CD-ROM.

When adjusting the lever reach, make sure the first phalanx of the index finger reaches around the brake lever (e). Check the proper adjustment and functioning of the brake system subsequently, as described in the chapter “The brake system” and in the instructions of the component manufacturer on this CENTURION CD-ROM.

⚠️ Make sure you cannot pull the brake levers all the way to the handlebars. Your maximum braking force should be reached short of this point.

ℹ️ In the case of hydraulic brakes and disc brakes follow the instructions of the brake manufacturer, which you can find on this CENTURION CD-ROM. If you are in doubt or if you have any questions, contact your CENTURION dealer.
Adjusting the tilt of the handlebars and brake levers of CENTURION road bikes with flat handlebars

The handlebars are usually slightly bent at the ends. Set the handlebars to a position in which your wrists are relaxed and not turned too much outwards.

Release the Allen bolt(s) at the bottom or front side of the stem. Turn the handlebars to the desired position. Make sure the handlebars are accurately centered in the stem. Carefully retighten the bolt(s) with the torque wrench.

Tighten all bolts with an Allen key by applying little force until the upper and the lower clamping slots of the handlebar clamp between faceplate and stem body are equal in width (f). Tighten the bolts alternately and in small increments with a torque wrench to the lower value of the recommended torque values.

Try rotating the handlebars once clamped in the stem (g) and tighten the bolt a little more, if necessary. Use a torque wrench and never exceed the maximum torque values! You find them directly on the components and/or in the instructions of the component manufacturers on this CENTURION CD-ROM.

If the handlebars are not tight with the prescribed torque value, use carbon assembly paste.

After adjusting the handlebars you need to adjust the brake lever/shifter units. Release the Allen bolt at either unit. Turn the levers relative to the handlebars. Sit in the saddle and place your fingers on the brake levers.

Check whether the back of your hand forms a straight line with the line of your forearm (h). Retighten the units with a torque wrench and do a twist test! The brake levers need not be absolutely tight. In case of a fall it is an advantage when the brake levers can be turned.

Tighten all bolts with an Allen key by applying little force until the upper and the lower clamping slots of the handlebar clamp between faceplate and stem body are equal in width. Tighten the bolts alternately and in small increments with a torque wrench to the lower value of the recommended torque values. The recommended torque values for 4-bolt-stems are 5-6 Nm. In the case of 4-bolt-faceplates tighten the bolts evenly in a cross pattern.
The brake system

Brakes \((a+b)\) are used to adjust your speed to the surrounding terrain and traffic. In an emergency situation, the brakes must bring your CENTURION road bike to a halt as quickly as possible.

In the event of such emergency brakings, the rider’s weight shifts forward abruptly, thus reducing the load on the rear wheel. The rate of deceleration is primarily limited by the danger of the rear wheel losing contact with the ground, resulting in an overturning of the CENTURION road bike and, secondly, by the grip of the tires on the road. This problem becomes particularly acute when riding downhill. Therefore, in case of an emergency braking you should try to shift your weight towards the rear and the ground as far as possible.

Actuate both brakes simultaneously and bear in mind that, due to the weight transfer, the front brakes can generate a far better braking effect on a surface with good grip. Wet weather reduces the braking power. Actuate the brakes carefully when riding on wet or slippery ground, as the tires can easily skid. Therefore, reduce your speed when riding in such conditions. Rim brakes are liable to overheating as a result of braking too long or brake dragging. This can damage the inner tube or make the tire slip on the rim, causing a sudden loss of air. Risk of an accident!

When riding downhill, get used to braking hard and then releasing the brake again, whenever the road surface and the situation allows for it. If you are in doubt about the braking action, stop and let the brake system cool down.

The assignment of brake lever to brake caliper can vary, e.g. left lever acts on front brake \((c)\). Have a look at the bike card and check whether the brake lever of the front brake is on the side you are used to (right or left). If it is not, ask your CENTURION dealer to switch the brake levers before you set off for the first time.

Be careful while getting used to the brakes. Practice emergency stops in a place clear of traffic until you are comfortable controlling your CENTURION bike. This can save you from having accidents in road traffic.

Wet weather reduces the braking effect and the road grip of the tires. Be aware of longer stopping distances when riding in the rain, reduce your speed and actuate the brakes carefully.

Ensure that braking surfaces and brake pads are absolutely free of wax, grease and oil. Risk of an accident!

When replacing any parts, be sure to only use parts that bear the appropriate mark and, to be on the safe side, original spare parts \((d)\). Your CENTURION dealer will be pleased to help you.

Be sure to observe the instructions of the brake manufacturers on this CENTURION CD-ROM before you start to readjust or to service the brake or before doing any work whatsoever.
Rim brakes

Racing/Side-pull brakes

Functioning and wear
Actuating the levers on the handlebars (e) and cables (f) causes a brake pad (g) to be pressed against a brake surface. The ensuing friction slows down the wheel. If water, dirt or oil come into contact with one of the braking surfaces, this changes the coefficient of friction and deceleration is reduced. This is why brakes respond with a slight delay and less powerfully in wet weather.

In order to maintain their effectiveness, brakes need to be checked and readjusted at regular intervals.

The friction generated by braking causes wear to the brake pads as well as to the rims. Frequent rides in the rain and dirt and over hilly terrain can accelerate wear on both braking surfaces. Some rims are provided with wear indicators, e.g. grooves or circular indentations. If the rim is worn down to the point where the grooves or indentations are no longer visible, it needs to be replaced. Once the abrasion of the rim has reached a certain critical point, the rim may break under the tire pressure. This can make the wheel jam or the inner tube burst. Risk of an accident!

Functional check
Test the brakes at standstill by firmly pulling the brake levers towards the handlebars. The brake pads of rim brakes must hit the rim evenly with their entire surface without touching the tire during braking or in open condition or in between.

Check whether the brake blocks are perfectly aligned with the rims and are still sufficiently thick. You can judge the wear of the brake pads by the appearance of grooves. If the pads are worn down to the bottom of the grooves (h), it is time to replace them. Be sure to observe the according instructions of the respective manufacturer.

The brake lever must always remain clear of the handlebars. You should not even be able to pull them all the way to the handlebars in the event of an emergency stop. If this is the case, however, observe the following chapter “Synchronizing and readjusting”.

See your CENTURION dealer and ask him to examine the remaining thickness of the rims when you are through your second set of brake pads at the latest. He has special measuring devices to determine the remaining thickness of the rims.

Both brake arms must hit the rim simultaneously, when you actuate the brake lever. They must keep off the tire.
The brake lever must always remain clear of the handlebars. You should not even be able to pull them all the way to the handlebars in the event of an emergency stop. If this is the case, however, observe the following chapter “Synchronizing and readjusting”.

Only a successful passing of all these points will ensure a correctly adjusted brake.

- **Brake cables (a)** which are damaged, e.g. frayed, must be replaced immediately, as they can otherwise fail in a critical moment, possibly causing a crash!

- **Adjusting the position of the brake blocks relative to the rims** requires a considerable degree of skill. Replacing and adjusting the brake blocks is a job best left to your CENTURION dealer.

- **Have your rims inspected and measured regularly by your CENTURION dealer (b).**

**Synchronizing and readjusting**
With dual pivot brakes, turn the small (headless) screw located at the side or on top of the caliper (c), until the left and right brake pad are at the same distance from the rim.

Also check whether the bolt by which the brake is screwed to the frame is still tightened to the proper torque, i.e. according to the torque value given in chapter “Recommended torque settings”.

The position of the brake lever where the brake starts to act, also referred to as the pressure point, can be adjusted to the size of the hand as well as to individual convenience by readjusting the brake cable. Make absolutely sure you cannot pull the brake lever all the way to the handlebar grip. With an unapplied brake the brake pads should not be too close to the rim sides, otherwise they could drag along the rim during riding. Before doing this adjustment, observe the notes in the chapter “Adjusting the brake lever reach on CENTURION road bikes”.

With ongoing brake pad wear, the pressure point at the brake lever moves towards the handlebars. Check the free travel at regular intervals; it should not be longer than a quarter of the whole travel. For re-adjustment turn the knurled nut or bolt (d) through which the cable runs into the brake body until the lever has the desired travel. Test the brakes subsequently in a place free of traffic.

Always test the brakes’ function at standstill after adjusting them, making sure the brake pads engage fully with the rim without touching the tire when you pull them hard. Make sure you cannot pull the lever all the way to the handlebars.
V-brakes

Functioning and wear
V-brakes (e) have two brake arms mounted separately on either side of the rim. When actuating the brake levers (f), both arms are pressed together by the cable, the pads touching the rim.

The friction generated by braking causes wear to the brake pads as well as to the rims. Frequent rides in the rain and dirt and over hilly terrain can accelerate wear on both braking surfaces. Some rims are provided with wear indicators, e.g. grooves or circular indentations. If the rim is worn down to the point where the grooves or indentations are no longer visible, it needs to be replaced. Once the abrasion of the rim has reached a certain critical point, the rim may break under the tire pressure. This can make the wheel jam or the inner tube burst. Risk of an accident!

Functional check
Check whether the brake blocks are perfectly aligned with the rims (g) and are still sufficiently thick. You can judge the wear of the brake pads by the appearance of grooves. If the pads are worn down to the bottom of the grooves, it is time to replace them. Be sure to observe the instructions of the respective manufacturer.

See your CENTURION dealer and ask him to examine the remaining thickness of the rims when you are through your second set of brake pads at the latest. He has special measuring devices to determine the remaining thickness of the rims.

The brake pads must hit the rim simultaneously, first touching it with the front portion of their surface. At the moment of first contact the rear portion of the facing should be a millimeter away from the rim. Viewed from the top the brake pads form a “V” with the trough pointing to the front. This setting is to prevent the brake pads from screeching when applied.

The brake lever must always remain clear of the handlebars. You should not even be able to pull them all the way to the handlebars in the event of an emergency stop. If this is the case, however, observe the following chapter “Synchronizing and readjusting”.

Only a successful passing of all these points will ensure a correctly adjusted brake.

Brake cables which are damaged, e.g. frayed, must be replaced immediately, as they can otherwise fail in a critical moment, possibly causing a crash!

Adjusting the position of the brake blocks relative to the rims requires a considerable degree of skill. Replacing and adjusting the brake blocks is a job best left to your CENTURION dealer.

Have your rims regularly inspected and measured by your CENTURION dealer.
Synchronizing and readjusting
Almost all brake designs have a bolt located next to one or both brake calipers for adjusting the spring preload (a). Turn the bolt slowly and watch how the gap changes between brake pads and rim.

Adjust the spring in a way that with an unapplied brake the gaps are equal on either side and the brake pads touch the rim simultaneously during braking.

The position of the brake lever where the brake starts to act, also referred to as the pressure point, can be adjusted to the size of the hand as well as to individual convenience by readjusting the brake cable. Make absolutely sure you cannot pull the brake lever all the way to the handlebar grip.

With an unapplied brake the brake pads should not be too close to the rim sides, otherwise they could drag along the rim during riding. Before doing this adjustment, observe the notes in the chapter “Adjusting the brake lever reach on CENTURION road bikes”.

To readjust the brakes, unscrew the knurled lock ring located at the point where the brake cable enters the brake lever on the handlebars (b). Unscrew the knurled, slotted adjusting bolt by a few turns (c). This reduces the free travel of the brake lever. Keeping the adjusting bolt firm, tighten the lock ring against the brake lever unit. This prevents the adjusting bolt from coming loose by itself. Ensure that the slot of the bolt faces neither forward nor upward, as this would permit water or dirt to enter more easily.

Always test the brakes’ function at standstill (d) after adjusting them, making sure the brake pads engage fully with the rim when you pull them hard.
Adjusting the brake lever reach

With disc brakes the brake levers can be adjusted to the size of your hands, too, allowing you to operate them with optimal effectiveness (e+f).

For more information see the chapter “Adjusting the brake lever reach on CENTURION road bikes” and in the original operating instructions of the brake manufacturer on this CENTURION CD-ROM.

After adjusting check the functioning and make sure the brake pads do not drag when releasing the brake lever and spinning the wheel.

Mechanical and hydraulic disc brakes

Functioning and wear

Actuating the hand lever on the handlebar causes stationary brake pads to be pressed against a rotating braking surface. The ensuing friction slows down the wheel. The rate of deceleration is not only determined by the force with which the brake pad is pressed against the braking surface, but also to a decisive degree by the coefficient of friction, which depends on the two materials that are rubbed against each other.

In the wet, disc brakes (g+h) respond much faster than rim brakes. They also require fairly little maintenance and do not wear down the rims as rim brakes do. One drawback of disc brakes is that they tend to be noisy when they are wet.

When water, dirt or oil gets in contact with one of the engaging surfaces, this changes the coefficient of friction. This is why disc brakes respond at a slight delay and less powerfully in wet weather. The friction generated by braking causes wear to the brake pads as well as to the rotors! Frequent rides in the rain hasten wear on both engaging surfaces.

Leakages in the lines of hydraulic brakes may render them ineffective. Remove such leakages immediately, otherwise risk of accident!

Damaged cables should be replaced immediately, as they can snap. Risk of an accident!

Disc brakes are susceptible to overheating during braking. Therefore, do not touch the disc or brake caliper after extensive usage of your brake, e.g. after riding downhill.

Ensure that rotors and brake pads are absolutely free of wax, grease and oil. Brake pads, once contaminated with oil cannot be cleaned, but have to be replaced!

Wet conditions and/or a heavily clogged brake can lead to squeaking noises during braking.

When replacing brake pads, be sure to only use marked original spare parts matching your brake.
Adjusting the brake lever reach

With disc brakes the brake levers can be adjusted to the size of your hands, too, allowing you to operate them with optimal effectiveness (a-c).

For more information see the chapter “Adjusting the brake lever reach on CENTURION road bikes” and in the original operating instructions of the brake manufacturer on this CENTURION CD-ROM.

After adjusting check the functioning and make sure the brake pads do not drag when releasing the brake lever and spinning the wheel.

Checking and readjusting in the case of mechanical disc brakes

Regularly check the braking response and the condition of the brake cables while pulling on the brake lever.

Do you get a clear-cut braking response when you pull the brake lever hard, and does the lever remain clear of the handlebars no matter how hard you pull?

To a certain extent, an increasing lever travel due to wear of the brake pads can be compensated at the additional brake lever’s adjusting element on the brake cable or directly at the brake caliper.

Unscrew the union nut on the bolt through which the cable enters the brake caliper (d) and then unscrew the bolt until the lever has the desired travel. Retighten the lock nut by taking care that the slit of the screw head does not face forward, as this would unnecessarily permit water or dirt to enter. There are some models which require an additional adjustment directly inside the brake caliper.

Check at regular intervals, whether the brake pads are still sufficiently thick. The wear of the pads can be checked at the inspection window on the upper side of the brake caliper. If there is approximately 1 mm of material left on each brake pad, remove the pads according to the manufacturer’s operating instructions, check them thoroughly and replace them, if necessary.

After readjusting check the functioning and make sure the brake pads do not drag when releasing the brake lever and spinning the wheel.

Repeated readjustment at the brake lever makes the arm on the brake caliper change its position. This can make the brake less effective and result in a complete brake failure in an extreme case. Risk of an accident!

Some models offer further ways of adjusting the brakes directly at the brake caliper, though this requires a certain amount of skill. Ask your CENTURION dealer for advice.
Repeated readjustment at the brake lever or brake caliper only can drastically reduce the maximum braking effect.

Brake cables which are damaged, e.g. frayed, must be replaced immediately, as they can otherwise fail in a critical moment, possibly causing a crash.

Some systems must be readjusted directly at the brake caliper to compensate wear. Be sure to read the operating instructions of the brake manufacturer on this CENTURION CD-ROM.

New brake pads have to be broken in before they reach their optimal braking power. Accelerate your CENTURION cyclo-cross or road bike 30 to 50 times to around 30 km/h and bring it to a halt each time.

In any case, be sure to read the original instructions of the brake manufacturer on this CENTURION CD-ROM before adjusting or servicing the brakes.

**Checking and readjusting in the case of hydraulic disc brakes**

Regularly check the lines and connections for leaks while pulling on the lever. If hydraulic oil or brake fluid leaks out, you should take appropriate measures immediately, as a leak can render your brakes ineffective. Ask your CENTURION dealer for advice. A leak in the brake lines can render the brake ineffective. Risk of an accident!

Most of the brake models are equipped with a mechanism which automatically compensates for the wear. Before every ride, check whether you get a clear-cut braking response before the lever touches the handlebars (e).

Check at regular intervals, whether the brake pads are still sufficiently thick (f). The wear of the pads can be checked at the inspection window on the upper side of the brake caliper. If there is approximately 1 mm of material left on each brake pad, remove the pads according to the manufacturer's operating instructions, check them thoroughly and replace them, if necessary.

The brake models of some manufacturers include transport locks (g) with cut-outs. The brake pads of these brakes must be replaced as soon as they fit into these cut-outs. Only use original replacement pads (h) and follow the operating instructions of the brake manufacturer on this CENTURION CD-ROM. If you have the slightest doubt, leave this job to your CENTURION dealer.
If your brake system works with DOT brake fluid, the latter needs to be re- placed regularly according to the intervals prescribed by the manufacturer.

Loose connections and leaky brake lines drastically impair braking power. If you find leaks in the brake system or buckled lines, contact your CENTURION dealer. Risk of an accident!

Do not transport your CENTURION road bike with saddle and handlebars upside down – risk of brake failure.

Do not open the brake lines. Brake fluid can be very unhealthy and damaging to the paint if it leaks out.

New brake pads have to be broken in \((a+b)\) before they reach their optimal braking power. Accelerate your CENTURION road bike 30 to 50 times to around 30 km/h and bring it to a halt each time \((c)\).

In any case, be sure to read the original instructions of the brake manufacturer on this CENTURION CD-ROM before adjusting or servicing the brakes.

Do not actuate the brake levers with the wheels dismounted. This would push the brake pads together, making it difficult to remount the wheel. Mount the enclosed transport locks \((d)\) after dismounting the wheels.

More information on adjustment and maintenance is available on the internet at

The gears

Derailleur gears

The gears (e-g) of your CENTURION road bike serve to adjust the gear ratio to the terrain you are riding on and the desired speed.

A low gear (where in the case of derailleur gears the chain runs on the small chainwheel and a large sprocket) (h) allows you to climb steep hills with moderate pedaling force. You must, however, pedal at a faster pace or higher frequency. High gears (large chainwheel, small sprocket) are for riding downhill. Every turn of the pedals takes you many meters forward at correspondingly high speed.

In general, your pedaling speed, also referred to as cadence, should be higher than 60 strokes a minute. Racing cyclists pedal at a rate between 90 and 110 strokes a minute on level ground. When climbing, your cadence will naturally fall off somewhat. Your pedaling should always remain fluent, however.

Continue pedaling during gear shifting, however, at clearly reduced pedaling force. In particular when shifting through the chainwheels continue pedaling slowly and without force.

Practice switching gears in a place free of traffic until you are familiar with the functioning of the brake lever/shifter units or the shifters of your bike.

Read the gear manufacturer’s operating instructions on this CENTURION CD-ROM and practice shifting gears until you are familiar with it before you set off for the first time.

Functioning and operation

Derailleur gears always work according to the following principle:

Large chainwheel (front) – heavy gear – bigger transmission

Small chainwheel (front) – easy gear – smaller transmission

Large sprocket (rear) – easy gear – smaller transmission

Small sprocket (rear) – heavy gear – bigger transmission

Normally the shifters are mounted as follows:

Right shifter – sprockets (rear)  
Left shifter – chainwheels (front)

Modern CENTURION bikes can have up to 33 gears. As there are, however, overlapping ranges, actually 15 to 18 gears are usable. It is not advisable to use gears which involve an extremely oblique run of the chain, as this reduces power transmission efficiency and hastens wear of the chain.
An unfavorable run of the chain is when the smallest chainwheel is used with one of the two or three outermost (smallest) sprockets (a) or when the largest chainwheel is used with one of the inmost (largest) sprockets (b).

The bottom bracket is the interface between cranks and frame. There are different designs, in some cases the bearing spindle is part of the bottom bracket, in some other cases it is integrated into the right crank. Sealed bottom brackets are maintenance free and delivered without play ex works. The bottom bracket in the frame must be checked for play at regular intervals.

Also check at regular intervals whether the cranks are firmly attached to the bearing spindle or whether there is play. Grab the crank and try to jiggle it forcefully. It must be absolutely free of play. If you notice any play, contact your CENTURION dealer immediately.

Depending on the gear system, gear shifting is initiated by actuating a brake lever/shifter unit (c+d) or by a shifter in the case of flatbars. Continue pedaling during gear shifting, however, with reduced pedaling force.

Please find below the most common brake levers/shifter units and their operation. It is, however, also possible that your new CENTURION road bike has a gear system that is not listed below.
In the case of **Shimano Dual Control (e)** brake lever/shifter units you shift to the larger chainwheels or sprockets by moving the entire brake lever inwards. You can shift up to two chainwheels or three sprockets per gear shift. By moving inward only the small lever located behind the brake lever, the chain moves on the smaller chainwheels or sprockets. You can shift only one chainwheel/sprocket per stroke.

The **Di2** is the electronic version of the high-quality drive systems from **Shimano**. Instead of cables the signal is transmitted by wires. The rear and the front derailleurs are moved by small electrical motors. The power supply is provided by a rechargeable battery that is mounted in the seat post **(f)**.

**The shifters are positioned and actuated like the mechanical gears:**
With a Di2 you must only press control buttons, instead of pressing the entire brake lever or the lever positioned behind inward as is the case with usual dual control shifters from Shimano. Shift to the larger sprockets by pressing the long control button on the side of the brake lever. When you press the triangular control button that is behind the brake lever the chain moves onto the smaller cogwheels.

**SRAM Force** brake levers/shifters **(g)** have only one shifter that is located behind the brake lever. With one complete sweep of the shifter, the rear derailleur shifts in a higher gear by one to two chainwheels or three sprockets. With a short sweep the chain changes to the next smaller chainwheel or sprocket.

In the case of **flatbar shifters (h)** the shifters are located underneath the handlebars. The right-hand, big shifter is actuated with the thumb. The chain moves on larger sprockets, i.e. to lower gears. The smaller shifter is actuated either with the index finger or with the thumb and shifts into the other direction. By actuating the big shifter with the thumb on the left side you shift to the larger chainwheel, i.e. to a higher gear ratio.

Always wear straight-cut trousers or use trouser clips or the like to make sure your trousers do not get caught in the chain or the chainwheels. Risk of an accident!

Shifting gears under load, i.e. while pedaling hard, can make the chain slip. At the front derailleur the chain may even slip off the chainwheels and result in an accident! At the very least the service life of the chain would be reduced considerably.
If there is play between bearing shaft and cranks, they can slip off and sustain damage. Risk of an accident!

Avoid gears which involve an extremely oblique run of the chain as this will increase wear!

Practice switching gears in a place free of traffic until you are familiar with the functioning of the brake lever/shifter units or the shifters of your CENTURION road bike.

Read the gear manufacturer’s operating instructions on this CENTURION CD-ROM and practice shifting gears until you are familiar with it before you set off for the first time.

Checking and readjusting

The derailleur gears of your CENTURION road bike were carefully adjusted by your CENTURION dealer before delivery. However, Bowden cables may stretch a little over the first kilometers, making gear shifting imprecise and the chain rattle.

Adjusting the front and rear derailleur (a) accurately is a job for an experienced mechanic. If you want to try to do the adjustment on your own, observe in addition the operating instructions of the gear manufacturer on this CENTURION CD-ROM. Contact your CENTURION dealer if you have any problems with the gears.

Adjusting the rear derailleur

Increase the tension of the Bowden cable by turning the adjustable down tube cable stop (b) or the adjusting bolt through which it runs into the rear derailleur (c). To do so, shift to the smallest sprocket and turn the bolts counterclockwise in half turns until the cable is slightly tensioned.

After tensioning the Bowden cable check whether the chain immediately climbs onto the next larger sprocket. To find out you lift the rear wheel and turn the cranks by hand or ride the CENTURION road bike and shift through the gears.

If the chain easily climbs onto the next larger sprocket, check whether it just as easily shifts to the small sprockets. If it does not, release the respective adjusting bolt a little. You may need several tries.

Adjusting the front and rear derailleur accurately is a job for an experienced mechanic. Observe the operating instructions of the gear manufacturer on this CENTURION CD-ROM. If you have any problems with the gears, contact your CENTURION dealer.

Ask a helper to lift the rear wheel. By turning the cranks and shifting through you can easily check the function.
Adjusting the limit stops

The rear derailleur is equipped with limit screws (d) which limit the movement range of the derailleur, thus preventing the derailleur and chain from colliding with the spokes or the chain from dropping off the smallest sprocket. The limit screws are adjusted by your CENTURION dealer. They do not alter their position during normal use.

If your CENTURION road bike fell over to the chain side or if you mount another wheel, it is imperative that you check the limit stops.

Shift with the right shift lever to the highest gear. The inner cable is relaxed and the chain running on the smallest sprocket. Look from the rear of the bike at the cassette and check whether the teeth of the smallest sprocket and the teeth of the top guide pulley are all in a perfectly vertical line. If necessary, correct the position by means of the limit screws (e). The limit screws on rear derailleurs are often marked “H” for high gear and “L” for low gear. “High gear” means that the chain is running on the smallest sprocket.

If the screws are not marked, you will have to find out by trial and error. Turn one of the bolts, counting the number of turns, and watch the rear derailleur. If it does not move, you are turning the wrong one. Turn back the counted rotations to find its original position.

Turn the screw clockwise to shift the rear derailleur towards the wheel and counterclockwise to shift it away from the wheel.

Shift carefully to the largest (inmost) sprocket (f) and check whether the teeth of the sprocket and the teeth of the guide pulley are all in a perfectly vertical line. Turn the limit screw marked “L” clockwise until the rear derailleur stops moving towards the spokes and can neither be moved by actuating the shift lever nor by pushing it with your hand (g). Carefully turn the cranks while checking.

This adjustment prevents the chain from getting stuck between sprocket and spokes or the rear derailleur or the derailleur cage from touching the spokes, which could result in damage to the spokes, the rear derailleur and the frame. In the worst case, it could be impossible to continue cycling.

Be sure to do a test ride in an unfrequented place after adjusting the gears.

If your CENTURION road bike has fallen over or the rear derailleur received a blow (h), the rear derailleur or its mount, also referred to as derailleur hanger, might be bent. It is advisable to check its range of movement and readjust the limit screws, if necessary, after such an incident or after mounting a new rear wheel on your bike.

Let your CENTURION dealer maintain and service your CENTURION road bike regularly.
Adjusting the front derailleur

The range within which the front derailleur (a) keeps the chain on the chainwheel without itself touching the chain is very small. If the chain tends to jump off the chainwheel, you will need to reduce the movement range in the same way as with the rear derailleur, i.e. by turning the limit screws marked “H” and “L” (b).

Start by shifting to the large chainwheel (front) and the smallest sprocket (rear) (c). Turn in the outer limit screw (“H”) exactly to the point where the chain does not touch the front derailleur, even under heavy load. And only at the point where the chain does not move from the middle to the large chainwheel any more, the limit screw can be released a little.

Continue by shifting to the smallest chainwheel (front) and the biggest sprocket (rear). Turn in the inner limit screw (“L”) exactly to the point where the chain does not touch the front derailleur. And only at the point where the chain does not move from the large or middle to the small chainwheel any more, the limit screw can be released a little.

This adjustment prevents the chain from falling off which would suddenly interrupt the drive involving the risk of an accident.

The parallelism to the longitudinal axis must be checked as well. Otherwise the crank may collide with the front derailleur tearing it off in the worst case. Shimano front derailleurs of the latest generation have a set screw for adjustment.

In cases of doubt this adjustment is a job best left to your CENTURION dealer.

As with the rear derailleur, the cable of the front derailleur is subject to lengthening which leads to a reduced precision in gear changing. If necessary, shift to the small chainwheel and increase the tension of the Bowden cable by turning the adjusting bolt through which it passes at the entry to the down tube cable stop.

Always check after an accident whether the guide plates of the front derailleur are still parallel to the chainwheels (d). Make sure they do not touch the large chainwheel. This would jam the drive or make the crank drag. Risk of an accident!

Adjusting the front derailleur is a very delicate job. Improper adjustment can cause the chain to jump off, thus interrupting the power train. Risk of an accident!

Be sure to do a test ride in an unfrequented place after adjusting the gears.
Shimano Di2

Adjustment and maintenance

If you wish, your CENTURION dealer can also change the functioning of the Di2 control buttons (e+f). The change has to be done with a special test device from Shimano which is also used for troubleshooting.

If you have smaller hands and want to position the levers closer to the handlebars, there are special adjusting screws on the handlebars. The handling of these screws is described in the chapter “Adjusting the brake lever reach on CENTURION road bikes”.

To adjust the rear derailleur shift into one of the middle gears press the button at the front switch under the handlebars until the control lamp illuminates red (g). The fine adjustment of the rear derailleur can now be carried out. Turn the crank and listen to the noise of the chain while running.

If there is a noise when the chain rolls off, press the front lever. With every push the rear derailleur moves inward by one decimillimeter. If the noise gets louder, press the rear lever.

The rear derailleur moves outwards in steps of one decimillimeter. Once the chain runs quietly, press the button at the switch once again, the red light goes out. Finish by shifting through all the gears to check the proper functioning.

Carefully shift through the gears until the chain runs on the biggest sprocket. If the shifting is not smooth, readjust once again.

Continue turning the crank carefully and make sure the rear derailleur cage does not collide with the spokes and the chain does not move beyond the biggest sprocket. While doing so, press your thumb against the rear derailleur.

In principle, the limit stops are adjusted like the limit stops of the mechanical gears (h). Be careful when shifting to the lowest and biggest gears in order to check the position of the limit stops.

Make a test ride in a place free of traffic before you use your new Di2 gears.

Read the operating instructions of the gear manufacturer on this CENTURION CD-ROM.
**Rechargeable battery**

A new, fully charged battery allows you to ride approx. 1,000 to 2,000 km. If the battery is charged to around 25 %, then this will be enough for around 250 kilometers.

Rechargeable batteries (a) have no memory effect. The battery can therefore be recharged without having run completely empty.

If the battery is dying, the front derailleur is the first to stop working. In this state you can still ride a few kilometers and change gears with the rear derailleur. The battery should, however, be recharged as soon as possible. When the rechargeable battery is empty, the rear derailleur remains in the last chosen gear. Shifting into another gear is no longer possible (b)!

You can check the battery’s state of charge at any time. To do so, press one of the control buttons (c) and keep it in this position for half a second at least. The LED on the control unit indicates the state of charge:

- green light is on for about 2 seconds: state of charge of the battery 100 %
- green light blinks 5 times: state of the charge of the battery approx. 50 %
- red light is on for about 2 seconds: state of charge of the battery approx. 25 %
- red light blinks 5 times: state of charge of the battery empty

The capacity of the battery (d) and thus the range will decrease gradually. This is unavoidable. You must replace the battery if the distance that you can ride is no longer sufficient for your requirements.

**⚠️** Only use the supplied charger to charge the battery!

**⚠️** If the rechargeable battery is not used for a longer period of time, it should neither be empty nor full. Keep the nearly charged battery (50% to 60%) in a dry, cool place and out of the reach of children. After three months at the latest you should check the state of charge. Protect the contact areas of your rechargeable battery with the protective covers before storing the battery.

**ℹ️** Charging of a (fully discharged) battery takes around one and a half hours.
Chain – care and wear

Regular and correct lubrication of your bike’s chain makes for enjoyable riding and prolongs its service life. It is not the quantity, but the distribution and regular application of lubricant that counts. Clean the dirt and oil off your chain with a slightly oily rag from time to time (e). Special degreasers are not necessary; they even have a damaging effect.

Having cleaned the chain as thoroughly as possible, apply chain oil, wax or grease to the chain links (f). To lubricate the chain, drip the lubricant onto the rollers of the lower run of the chain while you turn the crank. Once this is done, turn the cranks a few more times; then let your CENTURION road bike rest for a few minutes so that the lubricant can disperse. Finally wipe off excess lubricant with a rag so that it does not spatter around during riding or can collect road dirt.

Make sure the braking surfaces of the rims, the rotors and the brake pads remain clear of lubricants, as the brakes will fail otherwise!

SRAM CX1 chains do have a particular tooth profile already when they are new. Always keep the cassette particularly clean and contact your CENTURION dealer, if you have any questions with regard to the state of wear.

For the sake of the environment, only use biodegradable lubricants. Bear in mind that some of the lubricant can end up on the ground, especially in wet conditions.

Chain maintenance

Although the chain is one of the wearing components of your CENTURION road bike, there are still ways for you to prolong its life. Make sure the chain is lubricated regularly, especially after riding in the rain. Try to only use gears which run the chain in the straightest line between the sprockets and chainwheels and get in the habit of high cadence pedaling.

The chains of bikes with derailleur gears are worn out after approx. 1,000 to 3,500 km or 50 to 125 hours of use. Heavily stretched chains impair the operation of derailleur gears. Cycling with a worn-out chain also accelerates the wear of the sprockets and chainwheels. Replacing these components is relatively expensive compared with the costs of a new chain. It is therefore advisable to check the condition of the chain at regular intervals.

Your CENTURION dealer has accurate measuring instruments (g) for checking the chain wear. Replacing the chain should ideally be left to an expert, as this requires special tools. In addition, you need to select a chain matching your gear system.

An improperly riveted or heavily worn chain can break and throw you off your bike.

When replacing your chain, only use appropriate and suitable original spare parts (h). Your CENTURION dealer will be pleased to help you.
The wheels and the tires

The wheel consists of the hub, the spokes and the rim. The tire is mounted onto the rim so that it encases the tube in the case of the most common system, i.e. the clincher or folding tires. There is a rim tape running around the rim well to protect the sensitive tube against the edges of the rim trough, which are often sharp (a).

Another system comprises the tubular tires which are glued on specific rims. A third system comprises tubeless tires which also require specific rims.

The wheels are subjected to considerable stress through the weight of the rider and any carried baggage as well as through bumpy road surfaces and terrain. Although wheels are manufactured with great care and delivered accurately trued, spokes and nipples can lose a little tension on the first kilometers. Ask your CENTURION dealer to check and true up the wheels after you have bedded them in over about 100 to 300 kilometers or 5 to 15 hours of use.

After the bedding-in period, check the wheels regularly. It will, however, rarely be necessary to tighten the spokes (b).

⚠️ Truing (retruing) wheels is a difficult job which you should definitely leave to your CENTURION dealer.

Tires, inner tubes, rim tape, inflation pressure

The tires should provide grip and traction. At the same time they should run smooth and enhance the rider’s comfort by absorbing small shocks. Both the rolling friction and the grip depend on the nature of the tire carcass, the rubber compound and the tire tread. Your CENTURION dealer will be pleased to help you choose from the numerous types of tires.

If you want to mount a new tire, you need to mind the sizing system and the actual size of the old tire.

The latter is specified in two different units on the side of the tire. One of the sizes is the standardized size in millimeters which is more precise, e.g. the number sequence 23-622 means that the tire is 23 mm wide when fully inflated and has an inner tire diameter of 622 millimeters. The other size is indicated in inches (e.g. 23x7/8 or 700x23c) (c).

Tires must be inflated to the proper inflation pressure (d) to provide an optimal compromise between smooth running and riding comfort. Properly inflated tires are also more resistant to punctures. An insufficiently inflated tire can easily get pinched (“snake-bite”), when it goes over a sharp curb.

The air pressure recommended by the manufacturer is given on the tire side or on the type label (e). The lower of the two pressure specifications makes for better cushioning for lightweight riders and is therefore best for cycling on a rough surface.
Rolling resistance on level ground decreases with growing pressure, but so does comfort. Highly inflated tires are therefore most suitable for heavy riders and for riding on tarred roads. Therefore, adjust the pressure to your weight and your riding habits.

Inflation pressure is often given in the old system of units, i.e. in psi (pounds per square inch). The table (f) gives the most common pressure values in terms of both systems.

Clincher and folding tires and rim alone are not able to hold the air. Therefore, an inner tube has to be placed inside the tire (g) to retain the air pressure.

The rims of clincher and folding tires require, in general, a high-value rim tape. This rim tape protects the inner tube from the braking heat which could make the tire burst.

In the case of tubular tires which must be glued to the rim the tire provides an airtight design without inner tube. In case of a puncture there is no inner tube to be removed or repaired. This particular design requires special rims without rim flanges.

If necessary, read the respective operating instructions on this CENTURION CD-ROM before working on such kind of tires. If you are in doubt or if you have any questions, contact your CENTURION dealer.

Tubeless tires can only be used in combination with specifically designed wheels. Pay attention to the manufacturer’s type designations (e.g. “2way-fit”).

With reduced pressure tubeless tires can be used as clincher tires depending on the tire width. The appropriate pressure for 75-kg-cyclists is usually 7 bar and for 65-kg-cyclists 6 bar. Make sure the pressure is not below 4.5 bar. Observe the marking on the tire sides regarding the maximum pressure.

Replace tires with a worn tread or with brittle or frayed sides. Dampness and dirt penetrating the tire can cause damage to its inner structure. The tube might burst. Risk of an accident!

If you mount a new tire with another size than the standard tire mounted, there is the risk of a toe overlap when riding at reduced speed, i.e. that the food collides with the front wheel. Risk of an accident!

If you mount wheels with carbon rims (h) on your CENTURION road bike, you must most probably change the brake pads, as conventional brake pads often do not provide the desired braking effect. It is essential to also observe the instructions of the wheel manufacturer on this CENTURION CD-ROM.

Clincher and folding tires allowing an inflation pressure of five bars or more have to be mounted on hook bead rims, identifiable by the designation “C”.

Observe the maximum pressure value of the rim. The pressure is dependent on the tire width. You can find the values in the operating instructions of the rim or wheel manufacturer on this CENTURION CD-ROM.
Always ride your bike with the prescribed tire pressure and check the pressure at regular intervals, at least once a week. Riding with too low or too high air pressure may make the tire come off the rim or burst.

**Valves**

There is only one valve type in general use on CENTURION road bikes: The Sclaverand or Presta valve that is designed to withstand extremely high pressures (a). It has a plastic cap protecting the valve from dirt.

You first have to undo the small knurled nut a little and depress it carefully until air starts to escape (b). Check the nut is tightened and seated in its stem, otherwise air may slowly leak out. It can be hard to inflate tires to the necessary pressure by using hand pumps. It is much easier with a foot-operated or a track pump equipped with a pressure gauge.

**Rim trueness and spoke tension**

For the true running of the wheel it is imperative that the tension exerted by the spokes is distributed evenly around the rim (c). If the tension of a single spoke changes, e.g. as a result of riding fast over a curb or of a loose nipple, the tensile forces acting on the rim become unbalanced and the wheel will no longer run true. The functioning of your CENTURION road bike may even be impaired before you notice the wobbling appearance of a wheel that has gone out of true.

With rim brakes the sides of the rims also serve as braking surfaces (d). An untrue wheel can impair your braking effect. It is therefore advisable to check the wheels for trueness from time to time. For this purpose lift the wheel off the ground and spin it with your hand. Watch the gap between the rim and the brake pads. If the gap varies by one millimeter or more, you should ask your CENTURION dealer to true up the wheel.

Do not ride with untrue wheels. In the case of extreme side-to-side wobbles, the brake pads of rim brakes can miss the rim and get caught in the spokes! This normally instantly jams the wheel and throws you off your bike.

Loose spokes must be tightened at once. Otherwise the load on the other spokes and the rim will increase.

Truing (retruing) wheels is a difficult job which you should definitely leave to your CENTURION dealer.

**Carbon wheels**

As carbon wheels (e+f) are made of carbon fiber reinforced plastic they come with particular aerodynamic properties and low weight.

In case you want to mount carbon wheels, ask your CENTURION dealer for advice.
The maximum additional load of 120 kg including rider, baggage (rucksack) and CENTURION road bike must not be exceeded. Trailers are permitted in general as long as the trailer load does not exceed 45 kg. Also observe the instructions of the wheel manufacturer on this CENTURION CD-ROM.

The braking surfaces of the carbon rims are sensitive to heat. Therefore, when you are riding in the mountains, avoid any drag braking. Riding downhill e.g. with a permanently activated rear wheel brake may heat up the material and result in a deformation.

The rim may sustain damage and the inner tube may burst, thus causing an accident. Always use both brakes simultaneously and release them intermittently to allow the material to cool off. If you are in doubt, stop and let them cool down.

Check the condition of the brake pads at short intervals, as they might wear down faster than with aluminum rims.

Please note that wet weather reduces the braking effect considerably. Do not go for a ride, when it is about to rain or in wet conditions. Nevertheless, if you find yourself with your road bike on a wet or moist road, ride particularly carefully and at clearly reduced speed.

Check the condition of the brakes and make sure you only ride with brake pads that are suitable for carbon rims!

Observe possible weight restrictions in the case of carbon wheels. For more information see the instructions of the wheel manufacturer on this CENTURION CD-ROM.

**Particularities of braking with carbon wheels**

As the braking surfaces are made of carbon (g), there are some things to keep in mind. Only use the brake pads of wheel manufacturers (h) that are suitable for carbon wheels, as they are designed to suit such types of rims.

Carbon brake pads usually wear down faster than conventional brake pads. Keep in mind that the braking response of the rims needs getting used to, in particular in wet conditions. Therefore, test your brakes in a place free of traffic until you have full control of your bike.
Tire puncture

Flat tires are the most common cause of puncture during cycling. However, as long as you have the necessary tools and a spare tube or a repair kit, this need not mean the end of your cycle ride. If your wheels are attached with quick-releases to the frame and the fork, you only need two tire levers and a pump (a).

Before removing a wheel, read the chapters “Mounting wheels” and “How to use quick-releases and thru axles”. If you are in doubt or if you have any questions, contact your CENTURION dealer.

Dismounting wheels

If you have typical road bike rim brakes, open the quick-release lever at the brake (Shimano, SRAM) (b).

If your bike has V-brakes you first have to unhook the brake cable from the brake arm. To do this, grip the rim with one hand and press the brake pads and/or arms together. In this position the brake hose can easily be unhooked (c).

If you have disc brakes (hydraulic or mechanic), check the position of the brake pads through the inspection window. In this way you will be able to tell later whether the brake pad is still in its proper position. Read the brake manufacturer’s operating instructions.

If you have derailleur gears, you should shift the chain to the smallest sprocket before removing the rear wheel. This shifts the rear derailleur right to the outside where it doesn’t interfere with the removal of the wheel. Open the quick-release of the wheel, as described in the chapter “How to use quick-releases and thru axles”.

If you cannot remove the front wheel after releasing the lever, this is due to the drop-out safety tabs. They come as metal catches which engage with recesses in the drop-outs. Just release the quick-release adjusting nut a little and slip the wheel past the tabs.

You will find it easier to remove the rear wheel, when you pull the rear derailleur slightly backwards (d). Lift your CENTURION road bike a little off the ground and give the wheel a light blow with your hand so that it drops out.

Rotors can become hot, so let them cool down before removing a wheel.

Do not pull the (disc) brake lever with a removed wheel and make sure to mount the safety locks when removing the wheel for a longer period of time.

Special case CX1: By pretensioning and simultaneously activating the lock key the cage lock blocks the cage in tensioned condition.
If you have a CENTURION bike with hydraulic disc brakes, never turn it upside down for repair work, i.e. with the handlebars and saddle underneath, as the brakes will fail otherwise.

Observe the operating instructions of the brake and the gear manufacturers on this CENTURION CD-ROM.

Clincher and folding tires

Dismounting tires

Remove the cap and the fastening nut off the valve and deflate the tire completely (e). Press both tire sides from the rim side towards the center of the rim. This will ease the removal.

Apply a plastic tire lever to one bead of the tire about 5 cm beside the valve (f) and lever the tire out of the rim in this area. Hold the tire lever fast in its position. Slip the second tire lever between rim and tire at a distance of about ten centimeters on the other side of the valve and lever the next portion of the bead over the edge of the rim (g).

After leveling a part of the tire bead over the edge of the rim you should normally be able to slip off the whole tire on one side by moving the tire lever around the whole circumference.

Now you can remove the inner tube. Make sure the valve does not get caught in the rim, as this can damage the inner tube. If necessary you can remove the whole tire by pulling the other tire bead off the rim. Repair the puncture according to the instructions of the repair kit manufacturer or replace the inner tube.

When you have removed the tire, you should also check the rim tape (h). It should lie squarely in the rim trough, covering all spoke nipples, and should neither be damaged nor brittle.

In the case of double wall rims the tape must cover the entire rim base, but it should not be so broad as to stand up along the inside edges of the rim trough. Rim tapes for this type of rim should only be made of fabric or durable plastic. If you are in doubt or if you have any questions, contact your CENTURION dealer.

If the fabric of the tire is destroyed by the perforating object, replace the tire to be on the safe side.

Replace spoilt rim tapes immediately.
If you get a puncture en route, inflate the inner tube and bring it close to your ear. In most cases you can hear the air coming out. At home you can help yourself with a bucket of water where you can locate the hole by the bubbles. When you have found the hole, look for the corresponding place on the tire and check it, as well. Often you will find the foreign body sticking in the tire. Otherwise another puncture can occur.

**Mounting tires**

When mounting a tire make sure that no foreign matter such as dirt or sand gets inside the tire and that you do not damage the inner tube in the process.

Slip one bead of the tire onto the rim. Using your thumbs, press one bead over the edge of the rim and then around the entire circumference. This should normally be possible without using tools.

Stick the valve of the inner tube through the hole in the rim (a). Inflate the inner tube slightly so that it becomes round and push it into the tire all the way round. Make sure not to leave any folds in the inner tube.

To finish mounting the tire, start at the opposite side of the valve. Using your thumbs, press as much of the second bead of the tire over the edge of the rim as you can (b).

Make sure the inner tube does not get pinched and squashed between the tire and the rim. You can prevent this by pushing the inner tube into the hollow of the tire (c) with a finger as you work along.

Work the tire into the rim by approaching the valve symmetrically from both sides. Towards the end, you will have to pull the tire vigorously downwards (d) to make the already mounted portion of the tire slip towards the deepest part of the rim well. This will ease the job noticeably on the last centimeters.

Before fitting the tire completely on the rim check again whether the inner tube lies properly inside the tire and press the last stretch of tire over the edge of the rim using the balls of your thumbs.

If this does not work, you will have to use the tire levers (e). Make sure that the bent ends point towards the inner tube and that the inner tube does not get damaged.

Push the valve subsequently a little into the tire so that the inner tube does not get caught between the rim and the tire beads. Check whether the valve stands upright. If not, dismount one bead again and reposition the inner tube.

To make sure the inner tube does not get pinched between the rim and the tire beads move it sideways back and forth between the sides of the rim. While doing so, also check whether the rim tape has shifted.
Inflate the tube to the desired pressure. The maximum pressure is indicated on the side of the tire.

Check whether the tire is properly seated by inspecting the fine witness line (f) on the tire just above the rim edge. This line should be even to the rim all around the tire. If it is not, deflate the tire a little and check again. Starting from the maximum tire pressure you can now reduce the pressure through the valve to suit your needs. Please observe the recommended tire pressure range (g).

**Tubular tires**

**Dismounting tires**

Deflate the tire completely. To dismount the tire, start opposite the valve by pushing the tire to the center of the rim (h) until there is a gap and the tire starts to come off. If the tire remains tight, stick a tire lever into the gap and lift the tire off the rim.

Replacing an individual tube is impossible. Instead you have to mount a complete tubular tire. En route the tire cannot be glued and is consequently not tight on the rim even when inflated.

Therefore, be sure to ride back very slowly and carefully by taking the shortest way possible. Back home, you have to glue the tubular tire, as described in the following.

**Mounting tires**

Careful mounting that will ensure that the tubular tire holds permanently must be done in steps and can take a long time. Some practice and experience with the tire adhesive used and the relevant model of tubular tire can speed up the work.

In general, mounting tubular tires is a job for your CENTURION dealer. Read the mounting instructions of the tire manufacturer before you start mounting.

Tubular tires can be glued either with liquid tire glue or with adhesive tapes. The positive factor about adhesive tapes is that the mounting is quick. However, the tire will not seat properly in all cases. If you have a puncture while out riding, the tape often remains on the tire that has been removed and the reserve tire no longer seats properly on the rim.

For that reason we recommend a solid bed made up of several layers of liquid rim cement (tire adhesive). This not only holds the tire better, but always remains stuck on the rim when removing the tire.

Nonetheless, here, too, the reserve tire must be pulled off once again after the ride. The existing bed and the tire are then treated with rim cement once again and the tire is mounted again to ensure that it seats properly.
If you have wheels with very high rims, undo the valve insert with the special mounting tool before the first mounting and take it out of the valve, and install a valve extension in its place (a). Screw the valve insert back into the lengthened valve. Now you can inflate and deflate the mounted tire via the extended valve in the usual way.

Inflate the tire to a point where it starts to become round and then stick the valve through the hole in the rim. Starting from the valve and working in both directions press the tire into the rim all the way round. If you are unable to mount it completely on the rim or if this would require excessive force, leave off trying, since it might not work with force alone.

After mounting the tubular tire, spin the wheel and see whether the tire runs true (b). The area where the valve comes out of the tire is often thickened which leads to a vertical runout of the rim and makes the wheel jolt during the ride. Remove the burrs from the valve hole of an aluminum rim or countersink it with a big drill, a triangular scraper or a round file.

If you have carbon rims, be careful when removing the burrs from the hole edge with a round file. Insert the file only from the outside to the inside and not vice versa, otherwise the fibers of the synthetic matrix might fray out. Seal the area with instant glue subsequently. This pretreatment will lead to an improved valve fitting to the rim.

We strongly recommend that you leave the unglued tire inflated on the rim for a few days to make the final mounting easier.

Subsequently, clean the base of the rim from grease or oil by using a rag soaked in spirit or benzine.

Wait for the solvent to evaporate completely before you start to glue the tire onto the rim. Gluing the tire (c) is easiest with the wheel clamped in a truing stand or mounted on an old fork clamped in a vice.

With liquid tire glue you will need several layers to create a good adhesive bed. Spread the tire glue evenly and as thinly as possible around almost the entire circumference of the rim.

With a little practice you will be able to apply the glue straight from the tube (d). If this does not work at first you might find it easier to use a stiff brush. If you are using tire glue from a can you will need a brush in any case. Let the tire glue dry until it loses its sticky liquid touch. This can take up to a few hours. In the same way add another two thin films of glue and let them dry. Leave the wheel as it is at least until the next day.
Before mounting the tire also apply a film of glue to the base tape. To complete the adhesive bed add one last film of glue. If necessary, you can leave a section of five to ten centimeters without glue at a place just opposite the valve to make it easier to remove the tire again at a later date.

Let the topmost layer dry for a short time and, while it still feels syrupy, place the wheel on the ground with the valve hole facing upward. Inflate the tire until it starts to round and then stick the valve through the valve hole and press it firmly against the rim. Make sure the sides of the tire do not touch the adhesive bed, since your tire will otherwise look smudgy right away.

If you have left the section opposite the valve hole free of glue, you need not be concerned about glue smearing on the ground or dirt getting into the glue when you place the wheel on the ground.

Take hold of the tire right and left of the valve with both hands, pull it vigorously downward and work it bit by bit into the base of the rim (e) until you have about 20 centimeters left to go.

Starting from the top again on either side of the valve pull the tire down with your hands, letting them gradually slip down to the not yet mounted section.

Keeping the tire taut by holding your fingers against the rim and your thumbs on the tire, brace the wheel against your hips. Heave the tire with both thumbs into the base of the rim (f).

When the tire is seated in the base, it has to be centered, as it will rarely run true right away. Clamp the wheel in the mounting stand again and spin it. If the tread does not run exactly in the center or if it swerves to the side at any place, lift it up at that place, twist it a little into true and let it go again.

When the tire runs smoothly in the center, take the wheel off the mounting stand and inflate the tire to approximately half its nominal pressure. Lean your hands on the ends of the axle and quick-release skewers and roll the wheel a few meters on the ground (g). As you roll the wheel, vary between pressing it vertically downward and at a slant to either side (h).

If the tire still runs true during the final check, inflate it to its maximum pressure, deflate until you have reached two thirds of the pressure and wait 8 hours at least or even better a whole day, before setting off for the first time. If possible, store the tire at warm temperatures! Beforehand adjust the pressure of the newly mounted tire according to the manufacturer’s recommendations and to your own needs.

A poorly glued tubular tire can come off the rim. Risk of an accident!
Benzine and tire glue should only be used in a well aired place, since both materials are highly flammable. Keep them in a safe place out of children’s reach.

Tire glues do not only stick on rims and tires, they also cling quite stubbornly to fingers and clothes. This makes it advisable to wear old clothes when mounting tubulars.

When mounting a tire on a rim that has already been used, it may be necessary to carefully remove glue residues and dirt with emery cloth. Be careful not to damage the carbon material. When you are done, wipe the rim with a soft rag and benzine.

Before removing a wheel, read the chapters “The wheels and the tires” and “How to use quick-releases and thru axles”.

If your bike has carbon rims, you have to use special tubular tire glue (a) (e.g. from Continental). Be sure to read the operating instructions of the manufacturer of tubular tire glue for carbon rims on this CENTURION CD-ROM before applying it.

See the video to enable you to properly glue Continental tubular tires, at www.conti-online.com

Mounting wheels

To mount a wheel follow the reverse procedure of wheel dismounting. If necessary, insert the brake discs between the brake pads. Make sure the wheel is correctly seated in the drop-outs and accurately centered between the fork legs or the rear and chainstays. Make sure that the quick-release and the drop-out catches are correctly seated. For more information see the chapter “How to use quick-releases and thru axles”.

Close the quick-release lever at the brake immediately (Shimano, SRAM) (b).

If you have V-brakes (c) hook up the brake cable at the brake arm. To do this, grip the rim with one hand and press the brake pads and/or the brake arms together. In this position the housing can easily be hooked up (d).

If you have disc brakes, check before mounting the wheel whether the brake pads rest snugly in their seats in the brake caliper body. The gaps between the brake pads and the wheel should be parallel and the wear indicators in their correct position. Make sure that you push the brake disk between the brake pads. After mounting the wheel and tightening the quick-release, pull the brake lever (several times, if you have disc brakes).
Lift your CENTURION road bike off the ground and spin the wheel with your hand. With the wheel spinning the rotor should not drag along the brake caliper or the brake pads and the rim should keep off the (rim) brake pads.

- Immediately put back the brake cable of rim brakes after having mounted the wheel!

- Before setting off again check that the brake surfaces and/or rotors are still free of grease or other lubricants after the wheel mounting.

- Check whether the brake pads hit the rotors or brake surfaces of the rims. Check the seating of the wheel attachment. Always do a brake test as described in the chapter “Before every ride”.

Special characteristics of carbon

Special characteristics of components made of carbon-fiber-reinforced plastics (e), also referred to as carbon or CRP, need to be taken into account.

Carbon is an extremely strong material which combines high resistance with low weight. After over-stress, however, carbon components, unlike metal parts, do not necessarily show durable or visible deformation even though some of the fibers may be damaged.

It is very dangerous to continue using the carbon component after an impact or undue stress, as it may fail without previous warning thereby causing an accident with unforeseeable consequences. For this reason we recommend that you have the component, or to be certain, the entire CENTURION bike checked by your CENTURION dealer after every incident, such as a crash.

Replace a damaged component (f-h) at once! Prevent further use by taking appropriate measures, i.e. saw the component into pieces. Damaged carbon frames can possibly be repaired. Contact your CENTURION dealer.
Carbon components must not be exposed to temperatures higher than 80° Celsius / 176° Fahrenheit. Therefore, never have a carbon component enameled or powder-coated. The temperatures required for enameling or powder-coating could destroy the component. Do not leave carbon fiber components near a source of heat or in your car during hot or sunny weather.

Carbon components have, like all lightweight bike components, a limited service life. For this reason, have the stem and the handlebars checked at regular intervals (e.g. every three years), even if they have not experienced any undue stress, such as an accident.

When you intend to transport your CENTURION bike in the boot of your car, be sure to protect the bike or the carbon frame and components. Blankets, foam tubes or the like are a suitable padding to protect the sensitive material from damage. Do not place any bags on your CENTURION bike lying in your car.

Always park your CENTURION bike carefully and make sure it does not topple over. Carbon frames and components may already sustain damage by simply toppling over and thereby hitting e.g. a sharp edge.

If carbon components on your CENTURION bike produce any creaking or cracking noises or show any external sign of damage, such as gouges, cracks, dents, discolorations etc., do not use the CENTURION bike any longer. Contact your CENTURION dealer immediately; he will check the component thoroughly.

Do not combine carbon handlebars with an aero bar, unless they are specifically approved. Do not shorten carbon handlebars or clamp the brake levers and shifters more in the middle than indicated or needed. Risk of breakage!

Make sure all carbon clamping areas are absolutely free of grease and other lubricants! Grease will penetrate the surface of the carbon material, thereby reducing the coefficient of friction. This will no longer provide reliable clamping within the prescribed torque values. Once greased, carbon components may never again ensure reliable clamping! Use a special carbon assembly paste (a) instead as offered by various manufacturers.

Most clamps of bike carrier systems are potential sources of damage to large-diameter frame tubes! As a result thereof carbon frames can fail during use without previous warning. However, there are special-purpose models which are suitable available in the car accessory trade. Inform yourself there or ask your CENTURION dealer for advice.
Do not clamp a carbon frame or seat post in the holding jaws of a workstand! The components may sustain damage. Mount a sturdy (aluminum) seat post instead and use it to clamp the frame, or choose a workstand that holds the frame at three points inside the frame triangle or that clamps the fork and bottom bracket shell.

Protect the exposed areas of your carbon frame (e.g. the head tube and the underside of the down tube) against rubbing cables or stone chips with special pads your CENTURION dealer keeps for sale.

Carbon fiber components are particularly vulnerable to damage caused by excessive clamping force. Carbon assembly paste creates extra friction between two surfaces, allowing the necessary torque value to be reduced by up to 30%. This is especially useful in the clamping areas of handlebars and stem, steerer tube and stem and seat post and stem, i.e. three areas where too much clamping force can damage either component, causing component failure or voiding the warranty. By reducing the clamping force, carbon assembly paste relieves stress on sensitive carbon surfaces, preventing damage to fibers or the cracking of the carbon substructure.

The headset

The headset connects the fork to the frame, but allows it to move freely. It must afford virtually no resistance to moving, if your CENTURION road bike is to go straight, stabilizing itself as it runs. The shocks caused by uneven road surfaces expose the headset to considerable levels of stress. In this way it can become loose and maladjusted.

Riding the bike with a loose headset greatly increases the stress on the fork and the bearings. This can lead to damage to the fork. Risk of an accident!

Checking and readjusting

Check the headset for play by placing your fingers around the upper head tube race. Bring your weight to bear on the saddle, pull the front brakes with your other hand and push your CENTURION road bike firmly back and forth with the wheel remaining on the ground. If the bearing has play, you will feel the upper head tube race moving in jerks relative to the lower head tube race - visible as a small gap in between the head tube races.

To check the bearing for ease of running, lift the frame until the front wheel is suspended in the air. The handlebars should turn from far left to far right without feeling roughness or tightness at any point.
With a gentle tap on the handlebars the fork should turn easily from the middle position. If you face any problems during the test, contact your CENTURION dealer.

Adjusting the headset requires a certain amount of experience and should therefore be left to your CENTURION dealer.

**Threadless headsets – Aheadset®**

This headset system is characterized by the fact that the stem is not in the fork steerer tube but clamps it from outside. Hence the stem is an important constituent part of the headset, clamping it therefore also sets the adjustment. You generally only need one or two Allen keys and a torque wrench to adjust an Aheadset®. Release the clamping bolt(s) located on the side of the stem by one to two turns (a). Gently tighten the countersunk adjusting bolt on top a little, e.g. by a quarter turn (b), by using an Allen key.

Align the stem so that the handlebars are not slanted. Make sure the front wheel is in line with the top tube and the stem. Tighten up the stem clamping screws. Use a torque wrench and never exceed the maximum torque values! You will find the prescribed values in the chapter “Recommended torque settings”, directly on the components and/or in the operating instructions of the component manufacturers on this CENTURION CD-ROM.

Check the headset for play as described above (c). Take care not to tighten the bearing too much, as this could easily destroy it.

Bear in mind that by overtightening the bolts the stem can crush the steerer tube. In particular, models with a carbon fork steerer tube react very sensitively to overloading as a result of overtightening the shaft clamp at the stem. Risk of breakage! Make sure the clamping area is absolutely free of grease when any of the clamping faces is made of carbon. Use carbon assembly paste in the clamping areas to ensure maximum clamping.

Check the secure seat of the stem by taking the front wheel between your legs and trying to turn the handlebars and stem relative to the wheel (d). A loose stem can cause bad accidents.

Never change the preloading mechanism in the inside of the fork steerer tube. Never install a star nut in carbon fork steerer tubes.

Do not overtighten the upper bolt, it only serves to adjust the headset play.

There can be several reasons why the bearings cannot be adjusted. If you are not absolutely sure, ask your CENTURION dealer for help.
Things worth knowing about your CENTURION road bike

Cycling helmets and glasses

Cycling helmets are a must when riding a bike. Your CENTURION dealer has a variety of styles and sizes.

Verify that the helmet complies with the test standard DIN EN 1078. Cycling helmets are only approved for use during cycling. Observe the manufacturer’s instructions.

Never ride without a helmet (e+f)! But remember that even the safest helmet is useless unless it fits properly and is correctly adjusted and fastened.

In addition to a cycling helmet and suitable clothing, cycling glasses are absolutely essential when you are riding your CENTURION road bike.

They do not only protect your eyes from the sun and the wind, but also keep out flies and other impurities that may impede your vision when they fly into your eyes. Risk of an accident!

Good cycling glasses must fit closely against your face so that the wind does not get into your eyes from the side. There are a great many different models, for example, without tinting and UV protection, which can be worn at night or in twilight conditions, or glasses with a high level of UV protection that you should wear if the sun is stronger.

Your CENTURION dealer has a wide range of cycling glasses available and will be pleased to advise you.

Clothing

Cycling trousers (g) are essential if you want to sit comfortably. These close-fitting trousers have special padding in the seat. They have no seams that can press into you and they do not form folds. Cycling trousers are therefore designed to be worn next to the skin.

Since sporty cycling will soon bring you out in a sweat, a jersey made of synthetic materials is ideal (h). The fibers themselves do not take up any moisture but instead wick the sweat away from the skin up to the surface of the materials and thus prevent you getting cold from the cool wind produced by your speed. On longer tours you should in addition have suitable protection against the rain. Your CENTURION dealer would be glad to help you choose the right equipment.

Never ride with wide-cut trousers or skirts that might get caught in the spokes, chain or chainwheels. To avoid any such mishap, use suitable clips or straps, if necessary.

For increased visibility to other road users be sure to wear striking and bright-colored clothing!
The pedals and the shoes

Cycling shoes (a) should be made of solid material to provide firm support for your feet. In addition, they should have a stiff sole so that the pedal cannot press through. The sole should not be too wide in the area of the heels, as the rear stays or the crank will otherwise get in the way of your pedaling. This will prevent your feet from assuming a natural position when pedaling and may cause knee pain in the long run.

Special cycling shoes are obligatory if your CENTURION road bike is equipped with clipless pedals. With these shoes cleats are fixed to the sole. They give you a firm connection between shoe and pedal and allow depending on the model an acceptable walking position.

The main advantage is that these clipless pedals (b) prevent your feet from slipping off when pedaling fast. They enable you not only to push but also to pull the pedals. This makes it easier to pedal fluidly and considerably improves the transmission of the force as opposed to pedals with an open pedal cage.

The usual way to engage with the pedal is to turn it from the lowest position of the crank to the horizontal using the tip of the cleat and push down on the back of it. Normally, the shoe engages with the pedal with a click which you will hear and feel clearly.

The release force of clipless pedals is adjusted by means of an Allen key (c). If there are any creaking or squeaking noises occurring, some grease applied to the contact points will solve the problem in most cases. These noises as well as lateral play of the shoe on the pedal can, however, be also signs of wear. Check the cleats at regular intervals.

Make sure the fastening bolts of the cleats are properly tightened, as you will find it almost impossible to disengage your shoe from the pedal, if the cleat is loose. Risk of an accident!

Taking up the pedals, engaging and disengaging the shoes should first be practiced at standstill. Later you can refine your technique in a place clear of traffic (d).

Ride your CENTURION road bike exclusively with toe-clip or step-in pedals (clipless pedals). When using pedals without devices to hold your feet in the correct place (i.a. flat pedals), there is the risk of the foot colliding with the front wheel. Risk of an accident!

Only use clipless pedals allowing you to engage and disengage smoothly. A defective pedal or a badly worn cleat can make the shoe disengage from the pedal. Or unclipping the shoe from the pedal is sometimes very difficult or even impossible. In both cases, there is the danger of an accident!

Make sure pedals and shoe soles are always clear of mud and other impurities (e) and grease the lock-in mechanism with lubricant at regular intervals.

Most cycling shoes with cleats are only suitable for walking to a limited extent. As the cleats, in particular when mounted to road bike shoes, are thicker than the sole, they provide less grip even on a non-slip ground. Be particularly careful.
Ask your CENTURION dealer for advice about the different shoe and pedal models. Cycling shoes come in various styles for specific uses.

Read the operating instructions of the pedal manufacturer on this CENTURION CD-ROM.

**Accessories**

In purchasing your CENTURION road bike you laid the foundation for many years and miles of enjoyable cycling. Whatever you are planning to do with your CENTURION road bike, be sure to have proper equipment and to keep a few tips in mind. Your CENTURION dealer has a variety of useful accessories on offer enhancing both your safety and convenience.

Your CENTURION road bike can be fitted with various kinds of accessories. Make sure to observe the requirements according to the traffic regulations in your country and of the DIN EN standards. Any retrofitted part must be compatible with your CENTURION road bike. If you are in doubt or if you have any questions, contact your CENTURION dealer.

Improper accessories may change the qualities of your CENTURION road bike and even cause an accident. Therefore, before fitting any accessories contact your CENTURION dealer and observe the instructions regarding the intended use of your CENTURION road bike.

Retrofitted accessories, such as mudguards, pannier racks etc. can impair the functioning of your CENTURION road bike. Ask your CENTURION dealer for advice before mounting any kind of accessories to your bike.

Before buying any additional bells or lighting accessories (f), inform yourself thoroughly whether they are permitted and tested and accordingly approved for use on public roads. Make sure additional battery/accumulator-powered lamps (g) are marked with the wavy line and the letter “K”.

**Bicycle locks**

Do not forget to take a high quality D-lock (h) or chain lock with you on your ride. The only way to effectively protect your CENTURION road bike against theft is to lock it to an immovable object.
**Puncture kit**

The most important accessories for a successful cycle tour are a tire pump and a small tool kit. The tool kit should include two plastic tire levers, the most commonly used Allen keys, a spare tube, a tire repair kit, your mobile phone, if necessary, and a little cash (a). You will be better prepared in case of a puncture.

**Cycle computers**

There are electronic computers that show your current and average speed, your daily and annual mileage as well as the duration of the present ride (b). Real de luxe models also give the highest speed achieved, differences in elevation, your cadence or your heart rate.

Today, there are global positioning systems (GPS) and specific power meters for optimal training on the market which are compatible with your CENTURION road bike.

**Aero or triathlon/time trial bars**

Before you mount aero or triathlon/time trial bars (c) on your CENTURION road bike, it is essential to find out first whether the handlebars or a corresponding attachment for use with your handlebars and stem are approved.

Read the operating instructions of the handlebar and stem manufacturers on this CENTURION CD-ROM. If you are in doubt or if you have any questions, contact your CENTURION dealer!

**Fenders/mudguards**

If you want to mount mudguards on your CENTURION road bike, ask your CENTURION dealer for advice. There are removable mudguards (d), also referred to as clip-on mudguards, as well as firmly attached models that provide more protection.

Retrofittable fenders for a fix fastening are usually made of plastics and are secured in the correct position by means of additional stays. The length of the stay is perfect when the bottom edge of the fender runs at an approx. distance of 15 mm in parallel to the tire.

For safety reasons the front wheel stays must have security fastenings. They prevent the tire from being blocked by impurities taken up by the front wheel from the ground. In this case the security fastening frees the stay and hereby prevents a possible accident. The plug connection can easily be refastened.

Damaged fenders should be replaced in any case. Risk of an accident!
Transporting baggage

There are various ways of carrying baggage on your CENTURION road bike. Your choice will primarily depend on the weight and volume of the baggage. Using a bicycle rucksack (e) is a convenient way of transporting baggage on a bike and therefore recommendable. You can also use pannier racks (f) or handlebar bags, but some CENTURION road bike models do not allow the mounting of these accessories. If you are in doubt or if you have any questions, contact your CENTURION dealer.

- If necessary, do not overload your CENTURION road bike (see “Bike card”) and also observe the maximum load capacity marked on or impressed in your pannier rack.

- Baggage generally changes the riding characteristics of your CENTURION road bike and increases your stopping distance! Practice riding a loaded road bike in a place clear of traffic.

Taking children with you

CENTURION road bikes are mainly not designed for taking children on them. This applies in particular to those with very light frames. Ask your CENTURION dealer for advice and have a look at the bike card. Also read the instructions of the child seat or the trailer which must be supplied by the manufacturers with the products.

- If you want to hitch a trailer (g) or a kids’ tandem bike/trailer system to your CENTURION road bike or if you want to mount a child seat on it, check whether the road bike is designed accordingly. Have a look at the bike card or ask your CENTURION dealer for advice.
Transporting the CENTURION bike

By car

Nearly every car accessory dealer and car company offers carrier systems (a) that allow the transport of a bike without disassembly.

The usual design involves rails fixed to the roof of the car onto which the bikes are fixed with clamps gripping the down tubes. This can, however, result in irreparable damage to the frame. High-end, very thin-walled aluminum or carbon fiber frames are particularly susceptible to this kind of damage. Due to the material properties of carbon fiber, you may not see severe damage at first sight, but it can result in an unforeseeable severe accident at a later date. There are, however, special suitable models available in the car accessory trade.

Rear carriers are becoming more and more popular. Their big advantage over roof carriers is that you do not have to lift up the bike so high to attach it. Make sure the clamps used do not cause any damage to the fork or frame. Risk of breakage!

Whatever system you opt for, make sure it complies with the relevant safety standards of your country, such as the GS mark.

Read the operating instructions of your bicycle carrier and observe the maximum load capacity and recommended or prescribed maximum speed. If applicable, comply with the required supporting load on the trailer hitch.

Do not buy a carrier on which your CENTURION road bike has to be mounted upside down, i.e. with the handlebars and saddle fixed face down to the carrier. This way of fastening the bike exposes handlebars, stem, saddle and seat post to extreme stress during transport. Do not opt for a carrier system with crank arm fit. Risk of breakage!

Check whether your CENTURION road bike is properly fastened before and at regular intervals during the journey. A bike that detaches from the carrier system may endanger other road users.

Always secure your CENTURION road bike or bike components when putting it/them into the interior of your car (b+c). Parts shifting around can impair your safety.

Most clamps are a potential source of damage to large-diameter frame tubes that are not designed to be fixed in such clamps (d)! Do not use such systems with carbon frames!
Please make sure the lights and the number plate of your car are not hidden from view. For some carriers, a second exterior rear view mirror is required by the road traffic regulations.

Make sure to remove all parts of your bike (tools, pannier bags, etc.) which may come loose during transport.

Do not store any traveling bags, suitcases or other objects on your CENTURION road bike inside your car.

If your bike has disc brakes, be sure to mount the safety locks (e) before transporting your CENTURION road/cyclo-cross bike with the wheels dismounted.

Pull the brake levers and secure them with a strong rubber band (f).

Bear in mind that your car may have a greater overall height or width. Measure the overall height and place a sign stating the height somewhere in the cockpit or on the steering wheel so that it can be easily seen.

By public transport

In cities the regulations for taking CENTURION bikes by public transport differ (g+h). There are e.g. some places where you are only allowed to travel with your CENTURION road bike during off-peak hours and with an additional bicycle ticket. Inform yourself in time about the regulations of carrying the pedelec before you start the trip!

In some trains you can stow your CENTURION road bike in multi-purpose compartments. They are often at the front or end of a train and marked with a bicycle sign.

Before you start your trip inform yourself in time about the conditions of carriage and also observe the regulations and rules about bike transport in the countries through which you intend to travel.
By plane

If you want to take your CENTURION road bike with you when you go on a trip by plane, pack it in an appropriate bicycle suitcase (a) or in a bicycle cardboard box that you can obtain from your CENTURION dealer. Special bicycle bags often do not provide sufficient protection for your CENTURION road bike. Pack the wheels (in particular carbon wheels) in special wheel bags to protect them inside the suitcase or cardboard box. Do not forget to take the necessary tools, a torque wrench and bits, carbon assembly paste and these operating instructions with you to be able to assemble your CENTURION road bike and to get it ready for use at your destination.

If your CENTURION road/cyclo-cross bike has disc brakes, be sure to mount the safety locks before transporting your CENTURION road bike with the wheels dismounted.

Pull the brake levers and secure them with a strong rubber band.

General notes on care and servicing

Maintenance and servicing

Your CENTURION dealer will have assembled and adjusted your CENTURION bike ready for use when you come to collect it. Nevertheless, your CENTURION bike needs regular servicing (b). Have your local CENTURION dealer do the scheduled maintenance work. This is the only way to ensure that all components function safely and reliably for many miles.

The bike will be due for its first service after 100 to 300 kilometers, 5 to 15 hours of initial use or four to six weeks. The bedding-in phase typically involves spokes slightly losing tension or gears coming out of adjustment, so there is every reason to have your CENTURION dealer service the CENTURION bike at this stage. This bedding-in process is unavoidable. Therefore, remember to make an appointment with your CENTURION bike dealer to have your new CENTURION bike inspected. This first service is very important for both functioning and durability of your CENTURION bike.

It is advisable to have your CENTURION bike serviced regularly by your CENTURION dealer after the bedding-in phase. If you ride a great deal on poor road surfaces or cross-country, it will require correspondingly shorter service periods. The off-season during the winter months is a very good time to take your CENTURION bike to your CENTURION dealer for the annual inspection, as they will have plenty of time for you and for servicing.
The intended use of the CENTURION bike includes regular servicing and the replacement of wearing parts in time, e.g. chains, brake pads (c) or Bowden and brake cables (d), and therefore has an influence on the warranty and the guarantee, as well.

For more information see the chapter “Service and maintenance schedule”.

**Servicing and repairs are jobs best left to your CENTURION dealer.** If you have your bike serviced by anyone else than an expert, you run the risk that parts of your CENTURION bike will fail. Risk of an accident!

When working on your CENTURION bike, restrict yourself to jobs for which you have the suitable tools, e.g. a torque wrench, and the necessary knowledge.

If a component needs to be replaced, make it a rule to only use original spare parts (e). Wearing parts of other manufacturers, e.g. brake pads or tires that are not of identical dimension, may render your CENTURION bike unsafe. Risk of an accident!

**Cleaning and caring for your CENTURION bike**

Dried sweat, dirt and salt from riding during the winter or in sea air can harm your CENTURION bike. You should therefore make it a habit of cleaning all components at regular intervals.

Avoid cleaning your bike with a high-pressure cleaner. The high-pressure jet is likely to enter bearings by passing through the seals and dilute the lubricants hereby increasing the friction. This destroys and impairs the functioning of the bearing races in the long term. High-pressure jets are also likely to remove frame stickers.

A much more gentle way of cleaning your bike is with a low-pressure water jet or a bucket of water and a sponge or a large brush. Cleaning your bike by hand has another positive side-effect: you may discover defects in the paint (f) as well as worn or defective components at an early stage.

Check the chain for wear (g) and relubricate (h) after cleaning and drying (see the chapter “Chain – care and wear” and the instructions of the component manufacturers on this CENTURION CD-ROM). Wipe dry the sliding surfaces of the suspension fork and the rear shock and apply special spray. Apply a coat of standard hard wax on painted, metal and carbon surfaces (except from brake surfaces and brake discs). Polish the waxed surfaces after drying to give them a nice shine.
Keep cleaning agents and chain oil clear of the brake pads, brake discs and rim sides (braking surfaces). Otherwise the brake could fail. Never grease or lubricate the clamping areas of a frame made of carbon, e.g. handlebars, stem, seat post and seat tube. Once greased, carbon components may never again ensure reliable clamping!

While cleaning, watch out for cracks, scratches, dents as well as deformed or discolored material. Have defective components replaced immediately and touch up paint defects. If you are in doubt or if you have any questions, contact your CENTURION dealer.

Only use petroleum-based solvents for cleaning tough oil or grease stains from paint and carbon surfaces. Never use degreasing agents containing acetone, methyl chloride or the like, or solvent-containing, non-neutral or chemical cleaning agents that could attack the surface!

Do not clean your CENTURION bike with a high-pressure cleaner or a water jet and if you do, be sure to keep it at a distance. Do not aim at the bearings.

Safekeeping and storing your CENTURION bike

If you regularly look after your CENTURION bike during the season, you will not need to take any special measures when storing it for a short time, apart from securing it against theft. Store your bike in a dry, well aerated place.

If you want to store your CENTURION bike for a longer period of time, e.g. over the winter months, please observe the following things: Inflated inner tubes tend to gradually lose air when the bike is not used for a long time. If your CENTURION bike is left standing on flat tires for an extended period, this can cause damage to the structure of the tires. It is therefore better to hang the wheels or the entire CENTURION bike (a) or to check the tire pressure regularly (b). Clean your CENTURION bike and protect it against corrosion. Your CENTURION dealer has special cleaning agents, e.g. spray wax.

Remove the seat post (c) and let moisture that may have entered dry. Spray a little finely atomized oil into the metal seat tube. However, do not apply oil in a carbon seat tube. Shift the gear to the smallest chainwheel and the smallest sprocket (d). This relaxes the cables and the springs.

There are hardly any waiting times at your CENTURION dealer during the winter months. In addition, many of the CENTURION dealers offer an annual check-up at a special price. Benefit from the idle time and ask your CENTURION dealer to do the scheduled maintenance work!
Service and maintenance schedule

It is advisable to have your CENTURION bike serviced regularly after the bedding-in phase. The schedule given in the table below is a rough guide for cyclists who ride their bike between 2,000 and 3,000 km or 100 to 150 hours of use a year.

If you consistently ride more or if you ride a great deal on poor road surfaces, the service intervals will shorten accordingly.

</table>

If you have a certain degree of mechanical skills, experience and suitable tools, such as a torque wrench, you should be able to do the checks marked • by yourself. If you come across any defects, take appropriate measures without delay. If you are in doubt or if you have any questions, contact your CENTURION dealer.

Jobs marked • are best left to your CENTURION dealer.

For your own safety, bring your CENTURION bike to your CENTURION bike dealer for its first inspection after 100 to 300 kilometers, 5 to 15 hours of initial use or four to six weeks, and at the very latest after three months.
Recommended torque settings

All bolted connections of the bike components have to be tightened carefully and checked regularly to ensure the safe and reliable operation of the CENTURION bike. This is best done with a torque wrench that disengages at the desired torque value or a click-type torque wrench. Tighten carefully by approaching the prescribed maximum torque value in small steps (0.5 Nm increments) and check in between the proper fit of the component. Never exceed the maximum torque value indicated by the manufacturer!

Where no maximum torque setting is given start with 2 Nm. Observe the indicated values and observe the values on the components and/or in the operating instructions of the component manufacturers on this CENTURION CD-ROM.

These values are reference values of the above-mentioned component manufacturers. Observe the values in the instructions of the component manufacturers on this CENTURION CD-ROM. These values do not apply to the components of other manufacturers.

Due to the unmanageable number of components on the market, CENTURION is not in a position to foresee every product that will be replaced or newly assembled by third parties. Therefore CENTURION denies any liability for such kind of additions or modifications with regard to compatibility, torque values etc. Whoever assembles or modifies the CENTURION road bike shall ensure that the road bike was assembled according to the state-of-the-art in science and technology.

Some components have the maximum permissible torque values printed on them. Use a torque wrench and never exceed the maximum torque value! If you are in doubt or if you have any questions, contact your CENTURION dealer.

For more information on components not listed in these tables, see the instructions of the component manufacturers on this CENTURION CD-ROM.
Legal requirements for riding on public roads

If you use your CENTURION bike for riding on public roads (a+b), it has to be equipped according to the regulations of your country.

Pay particular attention to your bicycle being equipped with the prescribed set of lights (c) and reflectors (d). Ask your CENTURION dealer to inform you about the road traffic regulations in force in your country. Make yourself familiar with the road traffic regulations for riding on public roads and off-road.
Warranty and guarantee

Your CENTURION bike was manufactured with great care. Normally it is delivered to you by your CENTURION bike dealer fully assembled.

As direct purchaser you have full warranty rights within the first two years after purchase. Please contact your CENTURION dealer in the event of defects.

To ensure a smooth handling of your complaint, it is necessary to present your receipt, your bike card, the handover report and the service reports. Therefore, be sure to keep these documents in a safe place.

To ensure a long service life and good durability of your CENTURION bike, use it only for its intended purpose (see the chapter “Intended use”). Please observe the permissible load specifications as specified on the bike card. Be sure to follow the mounting instructions of the manufacturers (above all, the torque values of the bolts) as well as the prescribed maintenance schedule.

Observe the checks and routines listed in these operating instructions or in any other operating instructions enclosed with this delivery (see the chapter “Service and maintenance schedule”) as well as any instructions concerning the replacement of safety-relevant components such as handlebars or brakes etc.

Keep in mind that retrofitted accessories can impair the functioning of your CENTURION bike. If you are in doubt or if you have any questions, contact your CENTURION dealer.

The law referring to full warranty rights is only valid in the countries where the law has been ratified according to the renewed European regulations. Please inform yourself about the situation in your country.

A note on wear

Some components of your CENTURION bike are subject to wear due to their function. The rate of wear will depend on care and maintenance and the way you use your CENTURION bike (mileage, riding in the rain, dirt, salt etc.). CENTURION bikes that are often left standing in the open may also be subject to increased wear through weathering.

The components below require regular care and maintenance. Nevertheless, sooner or later they will reach the end of their service life, depending on conditions and intensity of use. The following parts which have reached their limit of wear must be replaced:

- Drive chain
- Brake pads
- Brake fluid (DOT)
- Brake discs/rotors
- Brake cables
- Brake cable housings
- Rims/rim sides (of rim brakes)
- Incandescent bulbs/LED
- Rubber grips
- Chainwheels
- Chainstay protection
- Handlebar tape
- Lamps
- Tire
- Sprockets
- Saddle
- Pulleys
- Bowden cables
- Bowden cable housings
- Tubes
- Lubricants
Guarantee on CENTURION bikes

In purchasing this CENTURION bike you will receive a warranty covering far more than stipulated by the legal regulations (as of date of purchase of initial buyer).

- A lifetime guarantee* against rupture for all aluminum and carbon frames for the categories Kids, Street, Cross, XC/Marathon and All Mountain (see chapter "Intended use")
- A five-year guarantee against rupture for all aluminum and carbon frames outside the aforementioned categories
- A five-year guarantee against rupture for aluminum and carbon rigid forks

CENTURION reserve the right to repair or replace the frame/the fork.

In the event the frame/fork model concerned is no (longer) available, CENTURION reserves the right provide a (successor) model of an equivalent or greater quality.

The guarantee does not cover labor and transport costs, nor does it cover follow-up costs resulting from defects.

Guarantee claims for suspension forks, rear shocks as well as drive units of pedelecs/EPACs (Electric Power Assisted Cycles) and other branded components will not be handled by CENTURION, but by the national distributors of the component manufacturers.

Your direct contact in any case is your CENTURION dealer.

The guarantee only applies to claims substantiated by presenting the original purchase contract, customer’s receipt, the handover report and the bike card stating the date of purchase, the dealer address, the model and the frame number. An online registration is also available at www.centurion.de/en_int (not available in all countries). This also applies within the statutory warranty/guarantee periods.

This additional guarantee is also valid when reselling a CENTURION bike. Prerequisite for that is the full traceability from the initial buyer to the last buyer. This is exclusively the case, if purchase contracts in written form can be presented in addition to the above-mentioned documents.

Guarantee claims will only be acknowledged, if the bike has been used for none other than its intended use, had an inspection during its first five hundred kilometers or the first six months after purchase, has been fitted exclusively with original spare parts or accessories and had its suspension systems serviced by a CENTURION dealer or an authorized service center once a year at least.

For carbon frames of the types road, cyclo-cross and mountain bike (suspension travel up to 100 mm) the above-mentioned guarantee also applies for competitive use. The guarantee does not cover the competitive use or other overloads for all other types.

It does not cover damage resulting from wear, insufficient care/maintenance, fall/accident, overstress caused by overloading, incorrect mounting and improper treatment as well as constructional changes to the bicycle (by using non-original spare parts as well as the installation and the modification of (additional) components.

Diligent compliance with the respective manufacturers’ mounting instructions and maintenance intervals as prescribed in this manual are crucial to a long service life and good durability of all bicycle components. Non-observance will render the guarantee void. Observe the checks described in this manual as well as all instructions concerning the regular replacement of safety-relevant components, such as the handlebars, stem etc.

The guarantee regulations going beyond the statutory regulations are voluntary services provided by CENTURION. These statutory regulations vary from country to country. Ask your CENTURION dealer for more information and read the original CENTURION operating instructions on the enclosed CENTURION CD-ROM.

* The service life of a bicycle is ten years.
In case of any inquiries, please contact your national distributor; visit www.centurion.de/en_int to find his address.

These provisions of the guarantee are applicable as of model year 2016.

Service schedule

1st service – After 100 – 300 kilometers or 5 – 15 hours of use or after three months from date of purchase at the latest

Order no.: Date:

Replaced or repaired parts:

Stamp and signature of the CENTURION dealer:

2nd service – After 2,000/3,000 kilometers or 100/150 hours of use or after one year at the latest

Order no.: Date:

Replaced or repaired parts:

Stamp and signature of the CENTURION dealer:

3rd service – After 4,000 kilometers or 200 hours of use or after two years at the latest

Order no.: Date:

Replaced or repaired parts:

Stamp and signature of the CENTURION dealer:

4th service – After 6,000 kilometers or 300 hours of use or after three years at the latest

Order no.: Date:

Replaced or repaired parts:

Stamp and signature of the CENTURION dealer:
5th service – After 8,000 kilometers or 400 hours of use or after four years at the latest

Order no.: Date:

Replaced or repaired parts:

Stamp and signature of the CENTURION dealer:

6th service – After 10,000 kilometers or 500 hours of use or after five years at the latest

Order no.: Date:

Replaced or repaired parts:

Stamp and signature of the CENTURION dealer:

7th service – After 12,000 kilometers or 600 hours of use or after six years at the latest

Order no.: Date:

Replaced or repaired parts:

Stamp and signature of the CENTURION dealer:

8th service – After 14,000 kilometers or 700 hours of use or after seven years at the latest

Order no.: Date:

Replaced or repaired parts:

Stamp and signature of the CENTURION dealer:
9th service – After 16,000 kilometers or 800 hours of use or after eight years at the latest

Order no.:  Date:

Replaced or repaired parts:

Stamp and signature of the CENTURION dealer:

11th service – After 20,000 kilometers or 1,000 hours of use or after ten years at the latest

Order no.:  Date:

Replaced or repaired parts:

Stamp and signature of the CENTURION dealer:

10th service – After 18,000 kilometers or 900 hours of use or after nine years at the latest

Order no.:  Date:

Replaced or repaired parts:

Stamp and signature of the CENTURION dealer:

12th service – After 22,000 kilometers or 1,100 hours of use or after eleven years at the latest

Order no.:  Date:

Replaced or repaired parts:

Stamp and signature of the CENTURION dealer:

Handover report

The above-described CENTURION bike was delivered to the customer ready for use, i.e. after its final assembly, inspection and functional check as described below (additionally required routines in parentheses).

- Lighting
- Brakes front and rear
- Wheel set (trueness/spoke tension/tire pressure)
- Handlebars/stem (position/bolts checked with torque wrench)
- Pedals (adjustment of release force if necessary)
- Saddle/seat post (height and position of saddle adjusted to suit customer, bolts checked with torque wrench)
- Gears (limit stops!)
- Bolted connections of attachment parts (check with torque wrench)
- Other routines performed
- Test ride
